OSCI-Transport, Version 2.0

2

3

– Web Services Profiling and Extensions Specification –

4

OSCI Steering Office

5

6

Status: Final Edition 4
Last edited on 14th of December, 2010

7 This is the approved final version of the OSCI 2.0 Web Services Profiling and Extensions
8 Specification. Minor clarifications may be eligible, which could result from perceptions made in the
9 implementation and/or rollout process. These will be published in future editions of this document. A
10 change history since edition 1 is provided in Appendix D.

11 The latest edition always will be available at www.osci.eu/transport/OSCI2/specification.

12 Editor of this document:

13 Jörg Apitzsch, bos bremen online services GmbH & Co. Kg, ja@bos-bremen.de

14 Quality Assurance:

15 Thilo Schuster, cit GmbH, thilo.schuster@cit.de

16 Further contributors are listed in Appendix E.

17 Comments and questions may be addressed to the above mentioned persons.

18

106 **1 Introduction**

107 The Web Services Profiling and Extensions Specification **Online Service Computer Interface Transport**
108 2.0 (OSCI 2.0) is made up of four documents:

109 (1) "OSCI-Transport 2.0 – Functional Requirements and Design Objectives"

110 (2) "OSCI-Transport 2 – Features and Architecture Overview"

111 and

112 (3) "OSCI Transport 2.0 – Web Services Profiling and Extensions Specification".

113 These four documents are accompanied by a common comprehensive glossary:

114 (4) "OSCI Transport 2 – Glossary".

115 While the technical overview and the specification and profiling documents are presented in English
116 language only, the other mentioned documents initially are available in German language.

117 The background and principles of the **Online Service Computer Interface (OSCI) Transport** specification
118 is explained in the document "OSCI-Transport 2 – Features and Architecture Overview", which should
119 be read first to obtain a basic understanding for the profiling and specifications outlined in the here
120 presented document.

121 **2 Document Structure**

122 Chapter [3] clarifies formal appointments concerning notational conventions, which is followed by a
123 summary of conformance targets and requirements.

124 Due to the proliferation of differing platforms and technologies in the eGovernment, it is essential to
125 ensure the different Web Service implementations are interoperable, regardless of the underlying
126 implementation and operation technology. Therefore, we mainly rely on the work which is done by the
127 Web Services Interoperability Organization¹, where profilings are compiled of the major Web Services
128 specifications under the aspect of best practices for Web Services interoperability. If needed to satisfy
129 the underlying OSCI requirements, we define further restrictions and processing rules in addition to
130 these profilings. This is outlined in the chapters [5 thru 7].

131 As OSCI Transport has to serve special requirements, which are not yet satisfied by currently
132 available Web Services specifications, chapter [8] specifies extensions to the WS-Stack for these
133 purposes.

134 Chapter [9] summarizes the constituent of the different OSCI message types, completed by hints
135 concerning policies and metadata definitions for nodes and endpoints of OSCI-based communication
136 networks in chapter [10].

137 Finally, in chapter [11] hints are given to realize services, which may be needed by applications for
138 end-to-end encryption and digital signature services on the content data level. Although a transport
139 protocol should be agnostic to payload carried, these services are needed to satisfy confidentiality,
140 legal bindings and non repudiation requirements.

141 In a continuing refinement process, this specification will be amended by example policies and
142 realization hints for selected classes of communication scenarios.

¹ see <http://www.ws-i.org/>

143 3 Document Conventions

144 3.1 Notational Conventions

145 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD
146 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as
147 described in [RFC2119].

148 This specification uses the following syntax to define normative outlines for messages:

- 149 • The syntax appears as an XML instance, but values in italics indicate data types instead of
150 values.
- 151 • Characters are appended to elements and attributes to indicate cardinality:
 - 152 ○ "?" (0 or 1)
 - 153 ○ "*" (0 or more)
 - 154 ○ "+" (1 or more)
- 155 • The character "|" is used to indicate a choice between alternatives.
- 156 • The characters "(" and ")" are used to indicate that contained items are to be treated as a
157 group with respect to cardinality or choice.
- 158 • An ellipsis (i.e. "...") indicates a point of extensibility that allows other child or attributes content
159 specified in this document. Additional children elements and/or attributes MAY be added at the
160 indicated extension points but they MUST NOT contradict the semantics of the parent and/or
161 owner, respectively. If an extension is not recognized it SHOULD be ignored.
- 162 • XML namespace prefixes (see section 3.2) are used to indicate the namespace of the element
163 being defined.

164 Elements and Attributes defined by this specification are referred to in the text of this document using
165 [XPath 1.0] expressions. Extensibility points are referred to using an extended version of this syntax:

- 166 • An element extensibility point is referred to using {any} in place of the element name. This
167 indicates that any element name can be used, from any namespace other than the osci:
168 namespace.
- 169 • An attribute extensibility point is referred to using @{any} in place of the attribute name. This
170 indicates that any attribute name from any namespace can be used.

171 For those parts of this specification where referenced specifications are profiled, normative statements
172 of requirements are presented in the following manner:

173 **Rnnnn** - *Statement text here*

174 where "nnnn" is replaced by a number that is unique among the requirements in this specification,
175 thereby forming a unique requirement identifier.

176 The terms "header" and "body" used in this document are used as abbreviation of "SOAP header"
177 respective "SOAP body".

178 Following legend applies for the message diagrams in this document:

- | | |
|-----|--|
| 179 | • Mandatory constituents have continuous lines, optional ones are marked dashed. |
| 180 | • Arrows on the left diagram side mark transport encryption requirements, those on the right |
| 181 | transport signature requirements. |
| 182 | • Encrypted message parts are marked by a hatched background. |

183

184 For explanation of used abbreviations and terms see the additional document "OSCI Transport 2.0 –
185 Glossary".

186 3.2 XML Namespaces

187 Following XML namespaces are referenced:

188 Table 1: Referenced Namespaces

189 4 Specification Conformance

190 4.1 Conformance Requirements

191 An implementation is not conformant with this specification if it fails to satisfy one or more of the
192 MUST, MUST NOT or REQUIRED level requirements defined herein.

193 A SOAP node MUST NOT use following XML namespace identifiers for the custom SOAP headers
194 defined in this specification within SOAP envelopes unless it is conformant with this specification:

- 195 • <http://www.osci.eu/ws/2008/05/osci-transport>
- 196 • <http://www.w3.org/2002/03/xkms#>
- 197 • <http://uri.peppol.eu/xkmsExt/v2#>.

198 Normative text within this specification takes precedence over normative outlines, which in turn take
199 precedence over the [XMLSchema] descriptions.

200 4.2 Conformance Targets

201 Conformance targets identify what artefacts (e.g., SOAP message, WSDL description, security token)
202 or parties (e.g., SOAP processor, end user) requirements apply to.

203 This allows for the definition of conformance in different contexts, to assure unambiguous
204 interpretation of the applicability of requirements, and to allow conformance testing of artefacts (e.g.,
205 SOAP messages and WSDL descriptions) and the behaviour of various parties to a Web Service (e.g.,
206 clients and service instances).

207 Requirements' conformance targets are physical artefacts wherever possible, to simplify testing and
208 avoid ambiguity.

209 The following conformance targets are used in this specification:

210 **OSCI MESSAGE** - protocol elements that profiles the SOAP Envelope, whereby following special
211 OSCI message types are defined:

212 **osci:Request, osci:Response, MsgBoxFetchRequest, MsgBoxResponse,**
213 **MsgBoxStatusListRequest, MsgBoxGetNextRequest, MsgBoxCloseRequest**

214 **OSCI GATEWAY** – an assembly of functionalities realized in software able to produce, send, receive
215 and consume OSCI Messages, hereby not concerned with SOAP Body entries (OSCI Messages for
216 MsgBox access and faults transmitted in the SOAP body excepted)

217 **DESCRIPTION** - descriptions of types, messages, interfaces and their concrete protocol and data
218 format bindings, and the network access points associated with Web Services (e.g., WSDL
219 descriptions)

220 **INITIATOR** – end point instance that generates a message according to the protocol associated with it
221 and that sends it to a RECIPIENT or MsgBox potentially through a message path that involves one or
222 multiple INTERMEDIARY(ies);

223 **RECIPIENT** – end point instance that consumes a message according to the protocol associated with
224 it.

225 **INTERMEDIARY** – node instance in the message path to the RECIPIENT which offers surplus to the
226 MESSAGE according to the protocol associated with it.

227 **MSG-BOX SERVICE** (short **MsgBox**) – specialized INTERMEDIARY instance that is able to relay
228 messages until they are pulled by the intended RECIPIENT according to the protocol defined here.

- 229 **ENDPOINT** – collective term for INITIATOR, RECIPIENT and MsgBox. Each ENDPOINT may be in
230 the role of a Security Token Requestor (STR)
- 231 **STR** – Security Token Requestor as defined by WS-Trust.
- 232 **STS** – Security Token Service as defined by WS-Trust.
- 233 **SAML-TOKEN** – Security Token as defined by SAML.

234 5 SOAP Version, Transport and Fault Binding

235 **R0010** - **OSCI Nodes** MUST support SOAP Version 1.2 according to [SOAP12] and constraints
236 specified in [WSI-Basic], chapter 3 Messaging with restriction **R0020**.

237 **R0020** - Transport binding is restricted to HTTP/1.1, which has performance advantages and is
238 more clearly specified than HTTP/1.0. R1140 of [WSI-Basic] (A MESSAGE SHOULD be
239 sent using HTTP/1.1) – is superseded: A **MESSAGE** MUST be sent using HTTP/1.1.

240 Note that this requirement does not prohibit the use of HTTPS.

241 **R0030** - Errors use the SOAP fault mechanisms. The SOAP fault block according to [SOAP12]
242 MUST be used to report information about errors occurring while processing a
243 SOAP/OSCI message. The `s12:Fault` element MUST be carried in the SOAP body
244 block of the network backchannel SOAP response message or – if no backchannel
245 available in asynchronous scenarios – in the SOAP body block of a distinct message of
246 `osci:Request`.

247 As specifications incorporated here in general define their own fault handling, this document only
248 outlines additional fault situations specific to OSCI Transport.

249 Following information for the sub elements `s12:Fault` is supplied per fault described in this
250 document:

251	Sub Element	Property Label	Possible values
252	<code>/Fault/Code/Value</code>	[Code]	Sender Receiver
253	<code>/Fault/Code/Value/Subcode</code>	[Subcode]	A local QName assigned to the fault
254	<code>/Fault/Reason/Text</code>	[Reason]	The English language reason explanation
255	In the fault message itself, the [Code] value MUST have a prefix of <code>s12:</code> ; the [Subcode] value prefix		
256	MUST be <code>osci:</code> .		
257	It should be noted that implementations MAY provide second-level details fields, but they should be		
258	careful not to introduce security vulnerabilities when doing so (e.g. by providing too detailed		
259	information).		

260 5.1 General processing error

261 If an unspecific and unrecoverable message processing error occurs, a fault MUST be generated and
262 the message MUST be discarded.

263 **NOTE:** There MUST NOT be generated a [Subcode] value prefix in this case!

264	Fault 1: ProcessingException		
265	[Code]	Receiver	
266	[Subcode]	ProcessingException	
267	[Reason]	Unspecific processing error	

268 Implementations MAY provide second-level details fields, e.g. a stack trace, if this information does
269 not lead to security vulnerabilities (see advise above).

270 5.2 Fault delivery, logging and escalation

271 In general, the fault handling defined in [SOAP12], chapter 5.4 "SOAP Fault" applies as well as the
272 respective fault handlings defined by the by OSCI incorporated specifications. Normally faults should

273 raise in situations where the Initiator can be informed directly about this fact. The fault MUST be
274 logged by the node where the fault raises to be available for supervision and revision purposes. If
275 faults raise at the node a message is targeted to, an according SOAP fault MUST be delivered in http
276 backchannel of the underlying request. Message processing MUST be aborted, if not specified
277 otherwise for special situations in this document.

278 Though, there exist situations where the possibility to deliver this information to the initiating node of
279 the underlying message does not exist. In this case, appropriate escalation mechanisms MUST be
280 foreseen by conformant implementations to signal such situations to the system monitoring
281 environment / operating personal; follow-up of this situation is up to the operating policies³.

³ Those should be made available online for all possible communication partners. Details are not addressed by this document.

282 6 Addressing Endpoints

283 The use of WS-Addressing with SOAP 1.2-binding and WS-Addressing Metadata is mandatory for
284 OSCI Transport.

285 **R0100** - **OSCI Nodes** MUST support WS-Addressing and WS-Addressing Metadata according to
286 [WSA] and [WSAM]. Constraints apply specified in [WSI-Basic], chapter 3.6 "Support for
287 WS-Addressing Messaging" and chapter 3.7 "Use of WS-Addressing MAPs".

288 **R0110** - **OSCI Nodes** MUST support WS-Addressing SOAP Binding according to [WSASOAP],
289 whereby only the rules for binding to SOAP 1.2 apply.

290 6.1 Use of WS-Addressing

291 The use of mechanisms specified by WS-Addressing [WSA] is REQUIRED. The use of WS-
292 Addressing MUST be expressed in the syntax defined by WS-Addressing metadata [WSAM] in the
293 WSDL describing and endpoint (see chapter [10]).

294 6.1.1 Endpoint Reference

295 WS-Addressing introduces the construct of endpoint references (EPR) and defines abstract properties
296 for one-way and request-response MEPs (see [WSA] , chapter 3.1), whereas OSCI regularly uses
297 request-response MEPs. The XML Infoset representation is given in [WSA] , chapter 3.2.

298 This specification defines following restrictions on the cardinality of elements contained in a type of
299 **wsa:EndpointReference** and concretion concerning the element **wsa:ReferenceParameters** :

```
300 <wsa:EndpointReference>
301   <wsa:Address> xs:anyURI </wsa:Address>
302   <wsa:ReferenceParameters>
303     <osci:TypeOfBusinessScenario>
304       osci:TypeofBusinessScenarioType
305     </osci:TypeOfBusinessScenario>
306   </wsa:ReferenceParameters> ?
307   <wsa:Metadata>
308     ( xmlns:wsdli="http://www.w3.org/ns/wsdli-instance"
309       wsdli:wsdliLocation= "xs:anyURI xs:anyURI"> ) |
310     xs:any *
311   </wsa:Metadata> ?
312 </wsa:EndpointReference>
313 <documentation> type definition of osci:TypeOfBusinessScenario
314 </documentation>
315 <osci:TypeOfBusinessScenarioType>
316   <xs:simpleContent>
317     <xs:extension base="xs:anyURI">
318       <xs:attribute ref="wsa:IsReferenceParameter" use="optional"/>
319     </xs:extension>
320   </xs:simpleContent>
321 </osci:TypeOfBusinessScenarioType>
```

322 **/wsa:ReferenceParameters**

323 **R0120** – If the URI value of ../wsa:Address is not equal to
324 "http://www.w3.org/2005/08/addressing/anonymous", an EPR MUST contain
325 one element **wsa:ReferenceParameters** which carries the type of business scenario
326 addressed by the message. This element is defined as type xs:any* and optional in
327 [WSA]. The type of business scenario MUST be tagged as URI in the OSCI namespace
328 as **osci:TypeOfBusinessScenario**.(see below).

329 Any endpoint SHOULD expose the types of business scenarios which it actually is able to
330 serve in WSDL [WSDL11] format. An XML schema definition for the Content Data to be

331 carried in the SOAP body of the message MUST be bound to the concrete tagged type of
 332 business scenario. Following the WSDL binding of WS-Addressing [WSAW], each
 333 **osci:TypeOfBusinessScenario** corresponds to a specific port [WSDL11] respective
 334 endpoint [WSDL20].

335 **/osci:TypeOfBusinessScenario**

336 The type of business scenario, it MUST be outlined as URI in the OSCI namespace.

337 **/osci:TypeOfBusinessScenario/@wsa:IsReferenceParameter**

338 Attribute of type xs:Boolean as described in [WSA]. Value is always true.

339 Following types of business scenarios MUST be served by all OSCI endpoints:

Type of business scenario URI	Meaning
http://www.osci.eu/ws/2008/05/common/urn/messageTypes/Receipt	Receipt type messages
http://www.osci.eu/ws/2008/05/common/urn/messageTypes/Notification	Notification type messages
http://www.osci.eu/ws/2008/05/common/urn/messageTypes/Fault	Fault type messages

340 Table 2: Predefined business scenario types

341 Following type of business scenario SHOULD be served by OSCI endpoints, which are
 342 intended to be able to support a common mail-style data exchange, optional carrying any
 343 type of attachments⁴:

344 **http://www.osci.eu/ws/2008/05/common/urn/messageTypes/LetterStyle**
 345

346 **/wsa:MetaData**

347 **R0130** - an EPR MAY have elements **/wsa:MetaData** which carry embedded or
 348 referenced metadata information assigned to this EPR.

349 Each OSCI endpoint SHOULD publish a link to its WSDL by using
 350 **wsdl:wsdlLocation**. Such elements define the metadata that is relevant to the
 351 interaction with the endpoint. An Initiator MUST have knowledge about following metadata
 352 specific for OSCI about the destination he is targeting a message to. At least, each OSCI
 353 endpoint SHOULD publish references to its encryption and signature certificate(s) in the
 354 OSCI specific policy **/osci:X509CertificateAssertion**⁵ by using the
 355 **wsse:SecurityTokenReference/wsse:Reference** token reference.

356 X.509-Certificate to be used for end-to-end encryption of Content Data as exposed in
 357 **/osci:X509CertificateAssertion**.

358 X.509-Certificate to possibly to be used for transport encryption (depending on concrete
 359 security policy) as exposed in **/osci:X509CertificateAssertion**.

360 X.509-Certificates used by the destination for receipt signatures, possibly those used for
 361 cryptographic time stamping, too (both exposed in
 362 **/osci:X509CertificateAssertion**).

⁴ The according content data schema will be made available as addendum short after publishing of this specification

⁵ Details are defined in chapter [10.2.1]

363 Availability of qualified time stamping service and policies those apply here (as exposed in
364 `/osci:QualTSPAssertion`⁶ .

365 Possible rules applied by the destination concerning message lifetime, if messages are
366 marked as valid for a restricted period of time (see chapter [8.1] for this issue; the
367 endpoint behaviour id outlined in the `/osci:ObsoleteAfterAssertion`⁶ of the OSCI
368 specific policy.

369 These requirements and capabilities of an OSCI endpoint SHOULD be described as
370 policies in machine readable form; for details, see chapter [10.2]. It is advised to carry
371 URI-references to these policies in `/wsa:MetaData`. Anyway, it is possible to embed
372 these policies in any WSDL (fragment) describing the OSCI endpoint or even to exchange
373 these information on informal basis out of scope of this specification.

374 6.1.2 Addressing Properties – SOAP Binding

375 This specification defines following restrictions on the cardinality of WS-Addressing message
376 addressing properties carried as SOAP header elements as outlined in Web Services Addressing 1.0
377 – SOAP Binding [WSASOAP]:

```
378 <wsa:To> xs:anyURI </wsa:To>
379 <wsa:From> wsa:EndpointReferenceType </wsa:From> ?
380 <wsa:ReplyTo> wsa:EndpointReferenceType </wsa:ReplyTo> ?
381 <wsa:FaultTo> wsa:EndpointReferenceType </wsa:FaultTo> ?
382 <wsa:Action>
383   http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/OSCIRequest |
384   http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/OSCIResponse |
385   http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxFetchRequ
386 est |
387   http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxStatusLis
388 tRequest |
389   http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxResponse
390 |
391   http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxGetNextRe
392 quest |
393   http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxCloseRequ
394 est
395 </wsa:Action>
396 <wsa:MessageID> xs:anyURI </wsa:MessageID>
397 <wsa:RelatesTo RelationshipType="xs:anyURI"?>xs:anyURI</wsa:RelatesTo> *
398 <wsa:ReferenceParameters>xs:any*</wsa:ReferenceParameters>
```

399 `/wsa:To`

400 The message final destination URI defined in `wsa:Address` is mapped to this SOAP
401 header element which MUST be provided exactly once.

402 `/wsa:From ?`

403 As OSCI is designed for authoritative communication, an OSCI message SHOULD carry
404 at most one SOAP header element `wsa:From` of type `wsa:EndpointReferenceType`.
405 If carried, the issuer of this message MUST expose here the EPR where he is able to
406 accept `osci:Request` messages according to R0120, R0130; it SHOULD carry the same
407 entries as `/wsa:ReplyTo`.

408 In case of an anonymous Initiator this EPR MAY contain the only child element
409 `wsa:Address` with a content of

410 `"http://www.w3.org/2005/08/addressing/anonymous"`.

411 `/wsa:ReplyTo ?`

⁶ See chapter [10.2.2]

412 **R0140** - in case of non-anonymous and/or asynchronous scenarios a messages of type
 413 `osci:Request` MUST carry exactly one SOAP header element `wsa:ReplyTo` of type
 414 `wsa:EndpointReferenceType`. This MUST contain the concrete EPR of the endpoint
 415 according to R0120, R0130; it denotes the final destination the Recipient MUST deliver
 416 the response to. The `wsa:ReferenceParameters` of this EPR SHOULD be the same
 417 as bound to the address element `wsa:To`.

418 If this element is not supplied, the `osci:Response` (or a fault) is delivered in the http-
 419 backchannel (semantics following [WSA], anonymous URI).

420 For sake of simplification, all other OSCI message types SHOULD NOT carry this SOAP
 421 header element, as for these message types reply destinations are defaulted to the
 422 anonymous URI or there is no need to generate related responses at all.

423 `/wsa:FaultTo` ?

424 **R0150** - If faults related to this message shall not (or cannot in asynchronous scenarios)
 425 be delivered in the network connection backchannel or it is intended to route such fault
 426 messages to specialized endpoints for consuming fault messages, an OSCI message
 427 SHOULD carry this optional element `wsa:FaultTo` of type
 428 `wsa:EndpointReferenceType`. This MUST be a concrete EPR according to R1020,
 429 R0130. To distinct such messages from other message types, the
 430 `wsa:ReferenceParameters` of this EPR MUST be

```
431 <osci:TypeOfBusinessScenario>
432   http://www.osci.eu/ws/2008/05/common/urn/messageTypes/Fault
433 </osci:TypeOfBusinessScenario>
```

434 In this case, a http response code of 500 MUST be returned in the backchannel of the
 435 SOAP request and the body of the SOAP response MUST carry the fault information in
 436 parallel to the fault message send to the endpoint denoted in `/wsa:FaultTo`.

437 If this element is not supplied, the fault only MUST be delivered in the http-backchannel.

438 `/wsa:Action`

439 **R0160** - this mandatory element of type `xs:anyURI` denotes the type of the OSCI
 440 message and MUST carry one of the values outlined in the table below. An OSCI
 441 message MUST carry exactly one `/wsa:Action` SOAP header element.

wsa:Action URIs assigned to OSCI Message Types
<code>http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/ osci:Request</code>
<code>http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/ osci:Response</code>
<code>http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/ MsgBoxFetchRequest</code>
<code>http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/ MsgBoxStatusListRequest</code>
<code>http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/ MsgBoxResponse</code>
<code>http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/ MsgBoxGetNextRequest</code>
<code>http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/ MsgBoxCloseRequest</code>

442	Table 3: Defined URIs for the WS Addressing Action element
443	If this header element has not one of the values outlined, the message MUST be
444	discarded and a fault MUST be generated.
445	Fault 2: AddrWrongActionURI
446	[Code] Sender
447	[Subcode] AddrWrongActionURI
448	[Reason] Invalid Action header URI value
449	/wsa:MessageID
450	R0170 - this mandatory element of type xs:anyURI MUST carry a unique message ID
451	(UUID) according to IETF RFC "A Universally Unique Identifier (UUID) URN Namespace"
452	[RFC4122]. An OSCI message MUST carry exactly one /wsa:MessageID SOAP header
453	element.
454	/wsa:RelatesTo *
455	R0180 - these optional elements of type xs:anyURI MUST be included, if a message is
456	to be seen as a response to preceding messages and in this case MUST carry the
457	wsa:MessageID SOAP header entry of those messages. This is always the case for the
458	network backchannel osci:Response and MsgBoxResponse . In case of asynchronous
459	responses on Content Data level (carried in a new osci:Request) the values for these
460	elements MUST be supplied by the responding Target Application. In case of an
461	OSCI fetched Notification (see chapter [8.3.3]), the value MUST be the one of the
462	message currently being fetched out of a MsgBox instance.
463	/wsa:RelatesTo/@RelationshipType ?
464	This optional attribute of type xs:anyURI SHOULD be omitted. Following the semantics
465	of [WSA], the implied value of this attribute is
466	"http://www.w3.org/2005/08/addressing/reply" .
467	/wsa:ReferenceParameters (mapped to osci:TypeOfBusinessScenario in the SOAP
468	binding)
469	R0190 - an OSCI message MUST carry at least one element according to the SOAP
470	mapping defined for wsa:ReferenceParameters . According to R0120, this is an URI
471	carried in a SOAP header element osci:TypeOfBusinessScenario which is bound
472	to the address element wsa:To . The SOAP header osci:TypeOfBusinessScenario
473	MUST carry an attribute wsa:IsReferenceParameter="true" .
474	If this header element is missing or the addressed endpoint is not able to serve the
475	concrete osci:TypeOfBusinessScenario , a fault MUST be generated and the
476	message MUST be discarded:
477	Fault 3: AddrWrongTypeOfBusinessScenario
478	[Code] Sender
479	[Subcode] AddrWrongTypeOfBusinessScenario
480	[Reason] Type of Business Scenario missing or not accepted

481 6.2 Non addressable Initiators and use of WS MakeConnection

482 Non-addressable Initiators themselves can create outbound connections but cannot accept
 483 connections from systems outside their network. This may be for reasons of network topology (i.e.
 484 NATs), security (i.e. firewalls), or whatever. In the view of the OSCI topology, such Initiators have even
 485 no **MsgBox** service available where asynchronous response messages can be targeted to SOAP

486 supports non-addressable clients by leveraging HTTP to take advantage of this fact. Non-addressable
487 SOAP clients create an outbound connection to a server, send the request message over this
488 connection, then read the corresponding response from that same connection (this response channel
489 is referred to as "the HTTP back-channel"). This is why non-addressable clients operate
490 synchronously, the response can be delivered in the http backchannel of the request. For this
491 behaviour, WS-Addressing specifies the anonymous URI to be carried in the /ReplyTo EPR:
492 "<http://www.w3.org/2005/08/addressing/anonymous>".

493 For responses to be delivered to non-addressable Initiators in an asynchronous way, the specification
494 WS MakeConnection [WSMC] defines mechanisms to uniquely identify anonymous endpoints as well
495 as making responses accessible for the Initiator in a response pulling manner. On the Recipient site
496 special features have to be foreseen to hold responses until they are pulled. The fact a Recipient
497 endpoint serves (and in this also requires) support of the MakeConnection protocol is indicated by a
498 policy assertion as described in chapter [10.3].

499 OSCI implementations MAY support WS MakeConnection; no profilings apply here. Special attention
500 should be taken here concerning the authentication requirements for anonymous Initiators and
501 message security to prevent unauthorized message access.

502 The mechanisms of the WS MakeConnection protocol is seen to be useful for more or less sporadic
503 OSCI based communication, where an initial registration process is not precondition to participate in
504 an OSCI network. For such use cases, example policies will be made available be one part of the
505 profilings addendum successively published from mid 2009 on.

506 **6.3 Addressings faults**

507 The WS Addressing fault handling defined in [WSASOAP], chapter 6 "Faults" applies. For general fault
508 handling, see chapter [5.2].

509 7 Message Security, Authentication and Authorization

510 For the achievement of message confidentiality and integrity, the specification Web Services Security:
511 SOAP Message Security 1.1 [WSS] is incorporated. The restrictions defined in the WS-I Basic
512 Security Profile [WSI-BSP11] MUST strictly be applied by conformant implementations and MUST be
513 matched by security policies defined for OSCI endpoints and service node instances.

514 Message protection mechanisms described here by means of encrypting and digitally signing only
515 address scenarios, where potentially unsecured network connections are used for message
516 exchange. Message exchange inside closed networks may be protected by other precautions out of
517 band of this specification. But even for those scenarios it should be kept in mind that most of data and
518 identity theft attacks are driven from inside companies, administrations and other institutions.

519 Every individual endpoint and service node SHOULD expose following information by means of WS
520 Security Policies [WSSP] attached to their respective WSDL:

- 521 • Possible use of transport layer mechanisms (HTTP over SSL/TLS); if useable the profiling of
522 [WSI-BSP11], chapter 3 "Transport Layer Mechanisms" is MUST be applied⁷.
- 523 • If message layer mechanisms must be used: Which message parts have to be encrypted and
524 signed as well as security token to be used for these purposes.
- 525 • What kind of token for authentication and authorization must be provided in a message.

526 Out of band agreement on these issues between communication partners is accepted, too.

527 7.1 WS Security header block

528 No profiling going beyond WS-I Basic Security Profile [WSI-BSP11] is made to the layout and
529 semantics of the `/wss:Security` SOAP header block as defined in Web Services Security [WSS]
530 except:

- 531 • Transport encryption and signing is achieved by means defined in [XMLDSIG] and [XENC] for
532 which profilings are made in the following subchapters [7.2] and [7.3]. As defined by security
533 policies, signature and/or encryption application to message parts is outlined in chapter [10].
- 534 • Supported security token types, outlined in chapter [7.4].

535 WS Security defines a Timestamp element for use in SOAP messages. OSCI places the following
536 constraint on its use:

537 **R0200** - A SOAP header `/wss:Security` MUST contain exactly one element
538 `/wsu:Timestamp`. This supersedes R3227 of [WSI-BSP11].⁸

539 7.2 XML Digital Signature

540 7.2.1 Restrictions to WS-I Basic Security Profiling

541 The profilings of [WSI-BSP11], chapter 9 "XML-Signature" is MUST be applied with following
542 restrictions going beyond them⁹:

543 **R0300** - Transform algorithm "`http://www.w3.org/2001/10/xml-exc-c14n#`" is
544 RECOMMENDED. This supersedes R5423 and R5412 of [WSI-BSP11] to clarify; this is

⁷ Applicable TLS/SSL versions and cyphersuites are defined here

⁸ "MUST NOT contain more than one" is profiled by [WSI-BSP11]

⁹ Recommendation: These restrictions SHOULD be regarded to by SAML-Token issuer's, too.

545 the recommended algorithm of the list of algorithms which MUST be used following [WSI-
546 BSP11].

547 **R0310** - As the digest algorithm SHA-1 is seen to be weak meanwhile, one of following digest
548 method algorithms MUST be used:

Digest method algorithms
http://www.w3.org/2001/04/xmlenc#sha256
http://www.w3.org/2001/04/xmlenc#sha512
http://www.w3.org/2001/04/xmlenc#ripemd160

549 Table 4: Digest method: allowed algorithm identifiers

550 The use of SHA-256 (<http://www.w3.org/2001/04/xmlenc#sha256>) as digest
551 method algorithm is RECOMMENDED. This supersedes R5420 of [WSI-BSP11]¹⁰.

552 **R0320** - As the digest algorithm SHA-1 is seen to be weak meanwhile, one of the signature
553 method algorithms listed here MUST be used:

Asymmetric signature method algorithms
http://www.w3.org/2001/04/xmldsig-more#rsa-sha256
http://www.w3.org/2001/04/xmldsig-more#rsa-sha512
http://www.w3.org/2001/04/xmldsig-more#rsa-ripemd160
Symmetric signature method algorithms
http://www.w3.org/2001/04/xmldsig-more#hmac-sha256
http://www.w3.org/2001/04/xmldsig-more#hmac-sha512

554 Table 5: Signature method: allowed algorithm identifiers

555 RECOMMENDED signature method algorithms are
556 <http://www.w3.org/2001/04/xmldsig-more#rsa-sha256> and
557 <http://www.w3.org/2001/04/xmldsig-more#hmac-sha256>. This supersedes
558 R5421 of [WSI-BSP11]¹¹.

559 **NOTE** on R0310, R0320: The URI-Values of the attributes `ds:SignatureMethod/@Algorithm`
560 and `ds:DigestMethod/@Algorithm` are fixed to identifiers resulting from the actual list of strong
561 hash algorithms published in [AlgCat]. One of the values outlined above MUST be chosen. *This*
562 *enumeration is subject to future changes, in case of one of the algorithms must be seen to get weak.*

563 7.2.2 Format of XML Digital Signatures used for Documents

564 Besides securing message integrity, digital signatures are used in OSCI Transport to sign
565 distinguished XML documents like policies and receipts, which in case of juridical conflicts must be
566 usable as proof.

¹⁰ SHOULD is defined by [WSI-BSP11] for <http://www.w3.org/2000/09/xmldsig#sha1>

¹¹ SHOULD is defined by [WSI-BSP11] for signature method algorithms based on SHA-1

567 Here, the national signature laws and ordinances must be considered; in consequence profilings of
 568 relevant standards have already been derived as well as classification of applicability of cryptographic
 569 algorithms. This leads to a profiling of those XML Digital Signatures, which are applied on documents
 570 as advanced or qualified signatures using an appropriate X.509v3-Certificate.

571 In summary, following profiling of [XMLDSIG] and [XAdES] applies:

572 **R0400** - The detached XML Signature format MUST be used and the signed content, if part of the
 573 message (child of SOAP envelope), be referenced by the local (fragment) URI mechanism
 574 as defined in [RFC2396]. Referencable fragments of message parts MUST carry an
 575 attribute of type **xs:ID**. The constraints of the XML 1.0 [XML 1.0] ID type MUST be met.
 576 The generation of unique ID attribute value SHOULD follow [RFC4122], this value
 577 SHOULD be concatenated to a preceding string "uuid:".¹²

578 **R0410** - A **ds:signature** element MUST contain at least one **ds:Object** child element to carry
 579 the signing time and a reference to the certificate used for signing. The format of this child
 580 element MUST conform to definitions given by [XAdES] with following restrictions applied
 581 here:

582 It MUST contain exactly on child element **xades:QualifyingProperties** including
 583 the mandatory child element
 584 **xades:SignedProperties/xades:SignedSignatureProperties** and an optional
 585 child element **xades:UnsignedProperties**, which is foreseen to carry a qualified
 586 timestamp over the signature itself in the child element
 587 **xades:UnsignedSignatureProperties/xades:SignatureTimeStamp**.

588 Child elements of **xades:SignedSignatureProperties** which MUST be present are
 589 **xades:SigningTime** and information about the certificate used for signing in
 590 **xades:SigningCertificate**.

591 **R0420** - As consequence of R0300 and R0310, a **ds:signature** element MUST contain at least
 592 two **ds:Reference** child elements for referencing at least one detached content and the
 593 elements in **ds:Object** to be included in the signature calculation.

594 **R0430** - Exclusive canonicalization MUST be used to address requirements resulting from
 595 scenarios where subdocuments are moved between contexts. The URI-Value of the
 596 attribute **ds:CanonicalizationMethod/@Algorithm** is fixed to
 597 "http://www.w3.org/2001/10/xml-exc-c14n#".¹³

598 **R0440** - Signatures are only applicable on base of X.509v3-Certificates which MUST conform to
 599 [COMPKI]. The child elements **ds:RetrievalMethod** and **ds:X509Data** of
 600 **ds:KeyInfo** MUST be present. All other choices according to [XMLDSIG] for
 601 **ds:KeyInfo** MUST NOT be present. In consequence, the attribute
 602 **ds:RetrievalMethod/@Type** MUST carry a value of
 603 "http://www.w3.org/2000/09/xml-dsig/X509Data".

604 **R0450** - The child elements **ds:X509IssuerSerial** and **ds:X509Certificate** of
 605 **ds:X509Data** MUST be present; the child element **ds:X509CRL** SHOULD NOT be
 606 present to avoid significant data overload of signature elements to be expected in case of
 607 including CRLs. All other choices according to [XMLDSIG] for **ds:X509CRL** and
 608 **ds:X509SKI** MUST NOT be present.

609 Details profiling and restrictions are defined by the following normative outline:

610 `<ds:Signature Id="xs:ID">`

¹² WS-Frameworks may foresee other ID attribute value generation mechanisms

¹³ See also: R5404 of [WSI-BSP11]

683     </xades:IssuerSerial>
684 </xades:Cert>
685 </xades:SigningCertificate>
686 </xades:SignedSignatureProperties>
687 </xades:SignedProperties>
688
689 ( <xades:UnsignedProperties Id="xs:ID" ?>
690     <xades:UnsignedSignatureProperties Id="xs:ID" ?>
691         <xades:SignatureTimeStamp Id="xs:ID" ?>
692             ( <ds:CanonicalizationMethod
693                 Algorithm="http://www.w3.org/2001/10/xml-exc-c14n#"
694             </ds:CanonicalizationMethod> ) ?
695         <xades:EncapsulatedTimeStamp>
696             Id="xs:ID" ? Encoding="xs:ID" ?>
697                 xs:base64Binary
698             </xades:EncapsulatedTimeStamp>
699         </xades:SignatureTimeStamp>
700     </xades:UnsignedSignatureProperties>
701 </xades:UnsignedProperties> ) ?
702
703 </xades:QualifyingProperties>
704 </ds:Object>
705 <ds:Object Id="xs:ID" ?/> ?
706 </ds:Signature>

```

707 The outline above shows mandatory and optional elements and their cardinality restrictions. For a
708 detailed description of elements and attributes in the outline above, see [XMLDSIG] and [XAdES].

709 For illustration, an example is given for an instance of such a signature element in Appendix C.

710 7.3 XML Encryption

711 In general, the profilings of [WSI-BSP11], chapter 9 "XML Encryption" is MUST be applied. If
712 encryption is applied, the SOAP envelope, header, or body elements MUST NOT be encrypted.
713 Encrypting these elements would break the SOAP processing model and is therefore prohibited (see
714 R5607 of [WSI-BSP11]).

715 Restrictions going beyond [WSI-BSP11] are defined in the following subchapters.

716 7.3.1 End-to-end Encryption of Content Data

717 Following general rules apply in addition to those presented in chapter [7.3.2]:

718 **R0400** - If MsgBox service instances are involved on the message route, a SOAP message body
719 block MUST be encrypted for the intended Ultimate Recipient following [XENC] using the
720 public key of his X.509v3 encryption certificate. For other MEP's, encryption of the SOAP
721 body block is RECOMMENDED.

- 722 **R0410** - A hybrid encryption algorithm MUST be applied: First a random session key is generated
 723 for a symmetric encryption algorithm. Using this key, the SOAP body blocks are
 724 encrypted. In a second step the session key is encrypted with the public encryption key of
 725 the Ultimate Recipient. The encrypted data and the encrypted session key build up the
 726 resulting SOAP body block of the message.
- 727 **R0420** - It MUST be ensured that not the same session key is used for data that are directed to
 728 different Ultimate Recipients.

7.3.2 Encryption Cyphersuite Restrictions

- 730 **R0500** - One of following symmetric block encryption algorithms MUST be used:

Encryption Algorithm	Algorithm Identifier
Two-Key-Triple-DES	http://www.w3.org/2001/04/xmlenc#tripleDES-cbc
AES-128	http://www.w3.org/2001/04/xmlenc#aes128-cbc
AES-192	http://www.w3.org/2001/04/xmlenc#aes192-cbc
AES-256	http://www.w3.org/2001/04/xmlenc#aes256-cbc

731 Table 6: Symmetric encryption algorithms

- 732 **R0510** - Encryption of symmetric keys MUST be performed by means of RSAES-OAEP-ENCRYPT
 733 [PKCS#1]. The value of `xenc:EncryptionMethod` MUST be
 734 **"http://www.w3.org/2001/04/xmlenc#rsa-oaep-mgf1p"**
- 735 **R0520** - The modulus length of a RSA key pair has to be at least 2048 bit.

7.4 Security Token Types

737 To be extensible, the WS-Security specification has not bound to specific security token types. For this
 738 version of OSCI Transport, token types outlined in following table MAY be used for authentication,
 739 message signature and encryption operations. Profilings of those token types have been specified by
 740 the OASIS Web Services Security Technical Committee.

Security Token Type	Support	Value of <code>wsse:BinarySecurityToken/@ValueType</code> and <code>wsse:SecurityTokenReference/wsse:KeyIdentifier/@ValueType</code>	Profiling Reference
SAMLV2.0	MUST	http://docs.oasis-open.org/wss/oasis-wss-saml-token-profile-1.1#SAMLV2.0	[WSSSAML]
X.509v3-Certificate	MUST	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-x509-token-profile-1.0#X509v3	[WSSX509]
Kerberos	MAY	http://docs.oasis-open.org/wss/oasis-wss-kerberos-token-profile-1.1#GSS_Kerberosv5_AP_REQ	[WSSKERB]
Username	MAY	Defined in WS-Security as <code>wsse:UsernameToken</code>	[WSSUSER]

741 Table 7: Security token types – support requirements

742 **R0600** - SAMLV20-Token MUST be used for authentication and message security within Trust
743 Domains as well as for cross domain message exchange – except R0610 applies.

744 If access of anonymous Initiators shall be supported, Public Key Infrastructure MUST be used
745 applying X.509v3-Certificates:

746 **R0610** - X.509v3-Certificate token issued by CAs MUST be used for authentication and message
747 security for scenarios allowing anonymous access. Validity of used certificates MUST be
748 verifiable by means of OCSP, LDAP or CRL.

749 The node a message is targeted to MUST verify the certificate validity; in case a value
750 other than valid at time of usage is stated, the message MUST be discarded and a fault
751 MUST be generated.

752 **Fault 4: AuthnCertNotValid**

753 [Code] Sender

754 [Subcode] AuthnCertNotValid

755 [Reason] Authentication certificate not stated to be valid

756 More information about the certificate validation results SHOULD be provided in the fault
757 [Details] property in this case. It is strongly RECOMMENDED to log such faults to be able
758 to detect possible security violation attacks.

759 **R0620** - X.509v3-Certificates used for authentication MUST have set the key usage extension set
760 to "digitalSignature". If the "nonRepudiation" key usage is set, these certificates MUST
761 not be used for authentication.¹⁴

762 Context conformant usage of certificates and their validity SHOULD be controlled by STS
763 respective message initiating instances to avoid subsequent violations of this requirement.
764 The node a message is targeted to MUST verify conformance this requirement; in case of
765 wrong key usage set, the message MUST be discarded and a fault MUST be generated.

766 **Fault 5: AuthnCertInvalidKeyUsage**

767 [Code] Sender

768 [Subcode] AuthnCertInvalidKeyUsage

769 [Reason] Certificate not permitted for authentication

770 Token of type Username and Kerberos MAY be used for authentication and securing messages inside
771 closed communication domains, where security and trust is given by means out of band of this
772 specification.

773 **7.5 Use of WS-Trust and SAML Token**

774 In general, means of WS-Trust SHOULD be used where all communication partners of a Trust
775 Domain are registered at an IdP, having a STS available for issuing SAML-Token.

776 **R0630** - Each access to an endpoint MUST be authorized by a STS instance of the endpoints
777 Trust Domain. A STS MUST be able to confirm the Requestors identity on base of
778 presented credentials.

779 For a given Trust Domain, the definition of a standard security policy and SAML Token layout is
780 RECOMMENDED, which can basically be used for message exchange inside this domain. If certain
781 services have special authentication and/or authorization requirements, this can be propagated in
782 according security policies bound to these services respective endpoints.

¹⁴ The signature used for authentication must not be confused with the legal declaration of intent given by a (qualified) digital signature.

783 To assure interoperability with WS-Trust/SAML infrastructures rolled out, both SAML Version 1.1 and
784 Version 2.0 SHOULD be support by OSCI implementation.

785 7.5.1 Authentication Strongness

786 Access authorization at least is given by the assurance of a certain level of authentication of the STR.
787 Trustworthiness of the STR identity confirmation thru an STS is given by the strongness of following
788 two processes:

- 789 • Initial registration of an endpoint at his IdP – organizational rules that applied for the degree of
790 trustworthiness initial subject identification
- 791 • Mechanisms used for authentication at the time of requesting identity confirmation from the
792 STS to match claimed and conformed identity.

793 [SAML1] respective [SAML2] and [SAMLAC] specify an authentication statement
794 **saml<1|2>:AuthnStatement** to carry such information. Differentiated authentication context details
795 may be included herein. To simplify processing and interoperability, following ascending levels for
796 strongness of registration and authentication are defined¹⁵:

- 797 • **urn:de:egov:names:fim:1.0:securitylevel:normal**
- 798 • **urn:de:egov:names:fim:1.0:securitylevel:high**
- 799 • **urn:de:egov:names:fim:1.0:securitylevel:veryhigh**

800 Each level matches operational rules which must be defined, published and continuously maintained
801 by appropriate institutions, i.e. government agencies concerned to data protection.¹⁶

802 [SAFE] defines extensions to the SAML authentication context element to carry the levels of
803 registration and authentication as follows:

```
804 <samlac:Extension>
805   <fimac:SecurityLevel>
806     <fimac:Authentication>
807       urn:de:egov:names:fim:1.0:securitylevel:normal |
808       urn:de:egov:names:fim:1.0:securitylevel:high |
809       urn:de:egov:names:fim:1.0:securitylevel:veryhigh |
810     </fimac:Authentication> ?
811     <fimac:Registration>
812       urn:de:egov:names:fim:1.0:securitylevel:normal |
813       urn:de:egov:names:fim:1.0:securitylevel:high |
814       urn:de:egov:names:fim:1.0:securitylevel:veryhigh |
815     </fimac:Registration> ?
816   </fimac:SecurityLevel> ?
817 </samlac:Extension> ?
```

818 This outline is preliminary to be seen as normative.

819 **/samlac:Extension ?**

820 Optional container carrying the extension; to be included in a SAML assertion in the
821 **samlac:AuthenticationContextDeclaration** element.

822 **.../fimac:SecurityLevel ?**

823 Optional container carrying the detail elements.

824 **.../fimac:SecurityLevel/fimac:Authentication ?**

825 Optional authentication level statement of type restriction to **xs:anyURI**; if present, the
826 URI value MUST be one of the enumerations listed above.

¹⁵ Preliminary URIs proposed by the SAFE-Project; subject to standardization activities by German administration

¹⁶ Definition of such rules can not be a matter of this specification. An example for a level “veryhigh” could be a registration data confirmation on base of presenting Id Cards and subsequent authentication using authentication certificates issued by accredited CAs.

827 `.../fimac:SecurityLevel/fimac:Registration ?`

828 Optional registration strongness statement of type restriction to `xs:anyURI`; if present,
829 the URI value MUST be one of the enumerations listed above.

830 If a SAML token of a message addressed to an endpoint does not match the minimal security level
831 requirements of this endpoint, the message MUST be discarded and a fault MUST be generated.

832 **Fault 6: AuthnSecurityLevelInsufficient**

833 [Code] Sender

834 [Subcode] AuthnSecurityLevelInsufficient

835 [Reason] Insufficient strongness of authentication or registration

836 Detailed information on the security level requirements SHOULD be provided in the fault [Details]
837 property in this case.

838 To facilitate the acquisition of an appropriate SAML token for the Initiator, endpoints SHOULD
839 describe their requirements on authentication strongness by means of WS-Policy as will be outlined by
840 concrete WSDL patterns published in 2009 as addendums to this document.

841 **7.5.2 WS-Trust Messages**

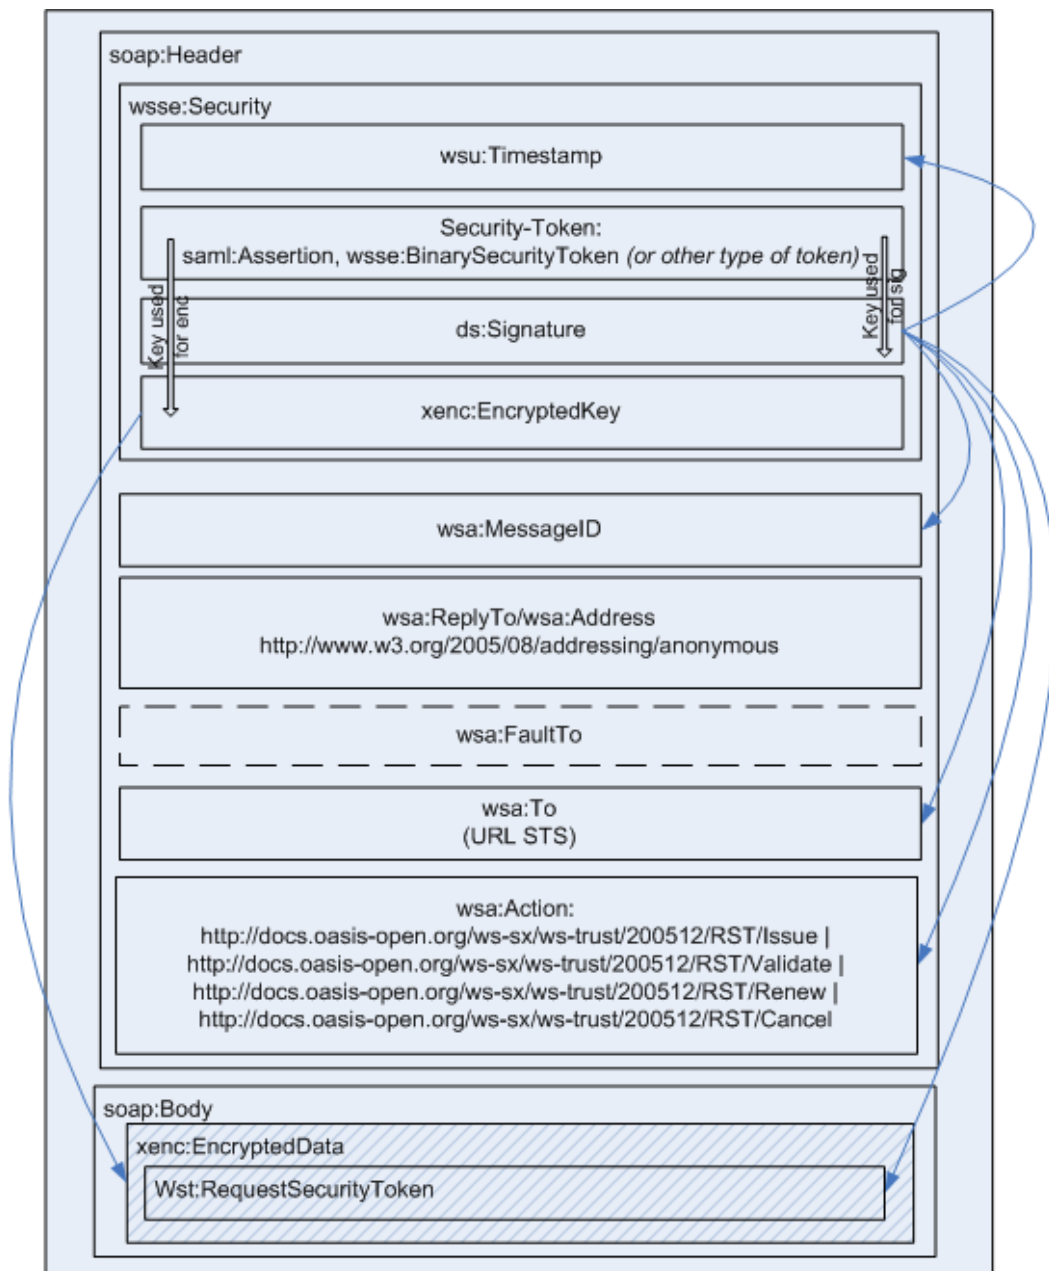

842 Conformant OSCI Gateway implementations MUST support the SOAP message types and bindings
843 defined by WS-Trust:

- 844 • Issue
- 845 • Validate
- 846 • Cancel.

847 The WS-Trust Renew-Binding SHOULD be supported for convenience; this functionality is supplied by
848 most STS-Implementations.

849 For clarification, an overview is given in following subchapters to the constituents of these message
850 types. For the exact definition of the according XML Infoset see [WST]; the present document
851 concentrates on restrictions to be applied by OSCI conformant implementations and a few hints.

852 **7.5.2.1 Request Security Token (RST)**

853
854 Figure 1: Request Security Token Message

855 SOAP header blocks:

856 **/wsse:Security**

857 This header block MUST be present, carrying message protection data and Initiator
858 authentication information according the security policy of the STS the RST message is
859 targeted to.

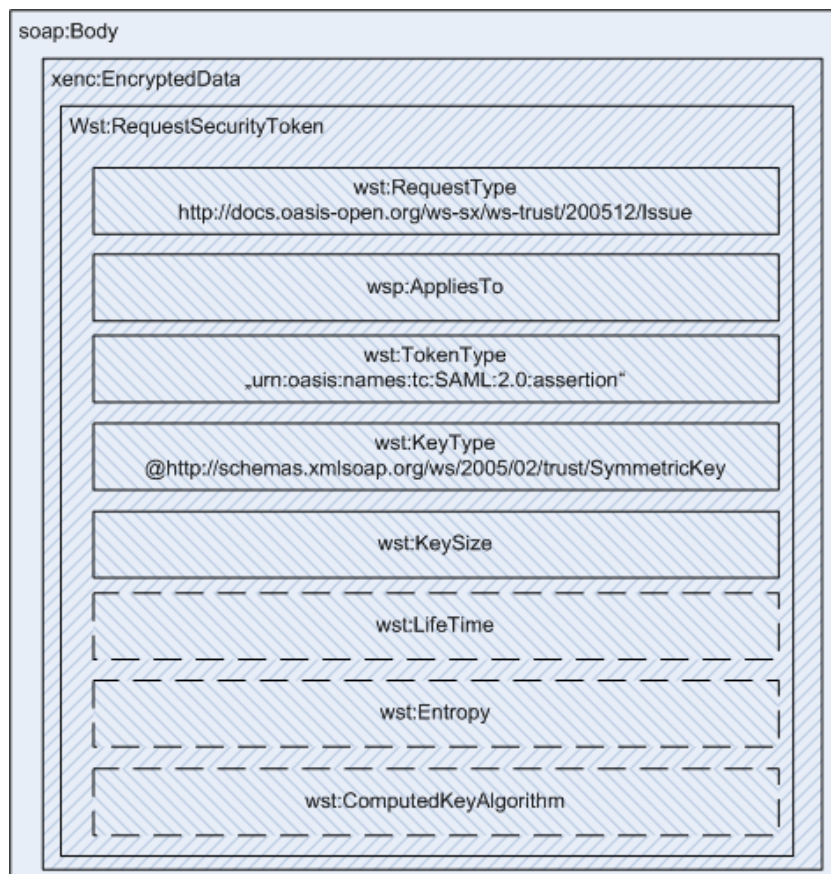

860 **/wsse:Security/wsust:Timestamp**

861 According to R0200, this header block MUST be present.

862 **/wsse:Security/[Security-Token]**

863 Security tokens MUST be used for signing and encrypting message parts. **ds:KeyInfo**
864 elements of subsequent **ds:Signature** or **xenc:EncryptedKey** elements MAY point
865 to security tokens carried here.

- 866 [Table 7] lists the security token types which MUST or MAY be supported.
- 867 Security tokens MUST be embedded or referenced. Referenced tokens MUST be
868 dereferencable by the targeted STS.
- 869 The Requestors security token MUST be used for signing the above marked message
870 parts.
- 871 **/wsse:Security/ds:Signature**
- 872 A signature containing **ds:Reference** elements to all message parts marked above to
873 be included in the signature.
- 874 **/wsse:Security/xenc:EncryptedKey**
- 875 The RST contained in the SOAP body block MUST be encrypted for the targeted STS.
876 This is a symmetric key which MUST be encrypted with the public key of the STS X.509v3
877 encryption certificate. Rules outlined in chapter [7.3] apply. It is assumed, that the STS
878 encryptions certificate is made available to all endpoints inside the STS Trust Domain out
879 of band of this specification.
- 880 **/wsa:***
- 881 All WS-Addressing headers MUST (if in continuous blocks) /MAY (if in dashed blocks) be
882 supplied by the Requestor.
- 883 **/wsa:Action**
- 884 Depending on the type of WS-Trust request, one of the URIs outlined above MUST be
885 supplied. This URI MUST be adequate to the respective body block content.
- 886 The SOAP body block MUST conform to the definitions of WS-Trust, whereby following restrictions
887 and recommendations apply for the WS-Trust Issue request type.

888

889

Figure 2: Request Security Token, Body for Issue Request

890 **/wsp:AppliesTo**

891 This element MUST be present; the value assigns a domain expression for the desired
892 application scope of the SAML-Token.

893 **NOTE:** For ease of message exchange inside a Trust Domain, it is RECOMMENDED to
894 choose an expression (i.e. URL pattern) accepted at least by a MsgBox instance for all
895 Recipients nodes using this MsgBox instance. This leverages the burden and overhead,
896 which would be given by a **/wsp:AppliesTo** value assignment to a concrete Recipient
897 EPR.

898 **/wst:TokenType**

899 **R0700:** This element MUST be present; the value MUST be a SAML V1.1 or V2.0
900 assertion type:

901 `urn:oasis:names:tc:SAML:2.0:assertion` |

902 `urn:oasis:names:tc:SAML:1.0:assertion`

903 **/wst:KeyType**

904 **R0710:** This element MUST be present; the value is restricted to:

905 `http://docs.oasis-open.org/ws-sx/ws-trust/200512/SymmetricKey`

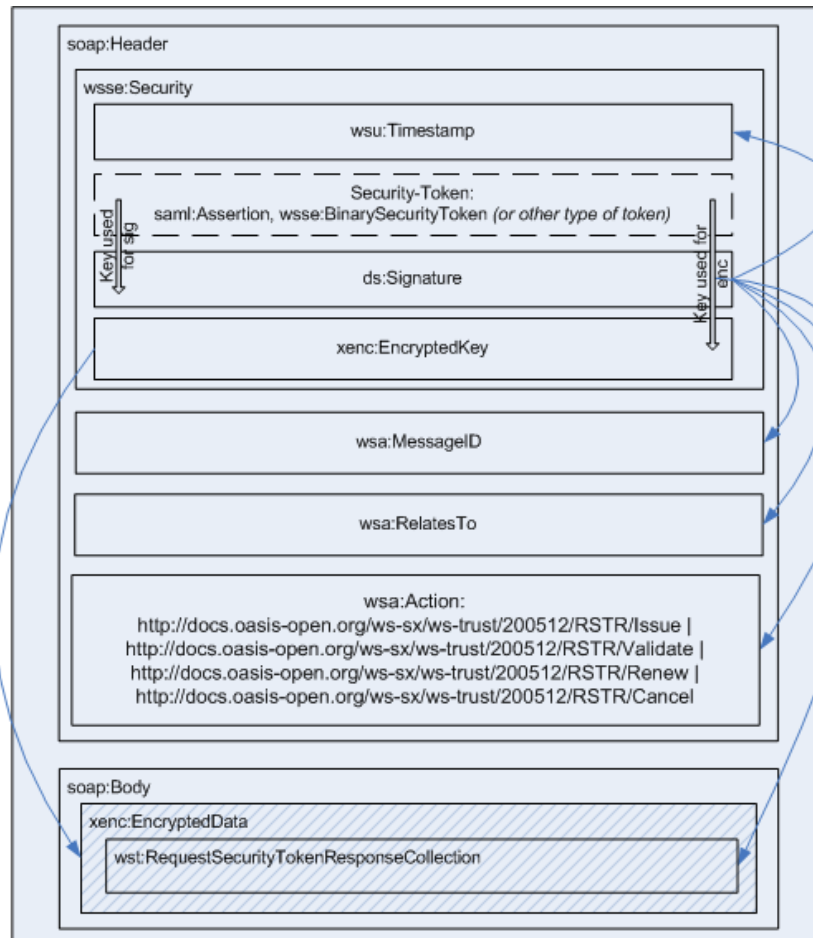

906 **/wst:KeySize**

907 **R0720:** This element MUST be present; the key size MUST be greater or equal 256 Bit.

908 Use and values of elements marked optional are subject to used STS instance specific policies.
909 Recommendations will we given as part of the amendments to be worked out for this specification in
910 2009 ff.

911 **7.5.2.2 Request Security Token Response (RSTR)**

912 The SOAP header resembles the one of the RST message:

913

914 Figure 3: Request Security Token Response Message

915 Differences to the RST message:

916 **/wsse:Security/xenc:EncryptedKey**

917 The RSTRC contained in the SOAP body block MUST be encrypted for the token
 918 Requestor. This is a symmetric key which MUST be encrypted with the public key of the
 919 Requestors X.509v3 encryption certificate. Rules outlined in chapter [7.3] apply.

920 **/wsa:***

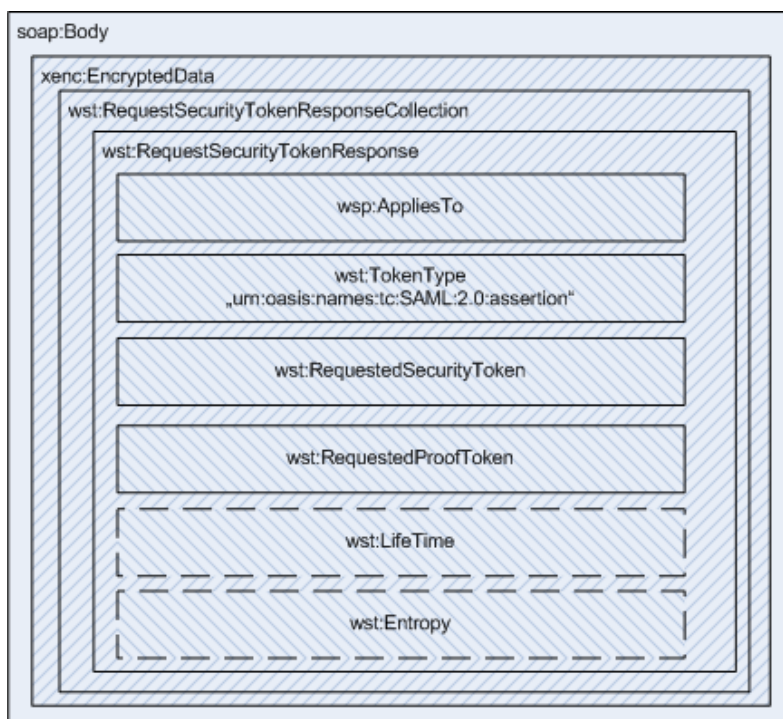

921 All WS-Addressing headers MUST (if in continuous blocks) /MAY (if in dashed blocks) be
 922 supplied by the STS.

923 **/wsa:Action**

924 Depending on the type of WS-Trust response, one of the URIs outlined above MUST be
 925 supplied. This URI MUST be adequate to the respective body block content.

926 The decrypted SOAP body block MUST conform to the definitions of WS-Trust. No restrictions or
 927 profilings apply.

928 The SOAP body block MUST conform to the definitions of WS-Trust:

929

930 Figure 4: Request Security Token, Body for Issue Response

931

932 Short description of the constituents of `/wst:RequestSecurityTokenResponse`, which is always wrapped by a `/wst:RequestSecurityTokenResponseCollection` (see [WST] for details):

933

933 **`/wsp:AppliesTo`**

934

935 Carries the value assignment for the desired application scope of the requested security token – copied from the according request element.

936

936 **`/wst:TokenType`**

937

938 Carries the token type, which MUST be the one of the according request element.

939

939 **`/wst:RequestedSecurityToken`**

940

941 Carries the requested SAML-Token, including a symmetric key encrypted for the endpoint at which the SAML-Token is needed for authentication purposes. Details explained in chapter [7.5.3].

942

942 **`/wst:RequestedProofToken`**

943

944 Carries information enabling the Requestor to deduce the symmetric key. In case the key was generated by the STS solely, this is the key itself.

945

946 In case computed of two entropy values, this is the algorithm and the element

947

947 **`/wst:Entropy ?`**

948

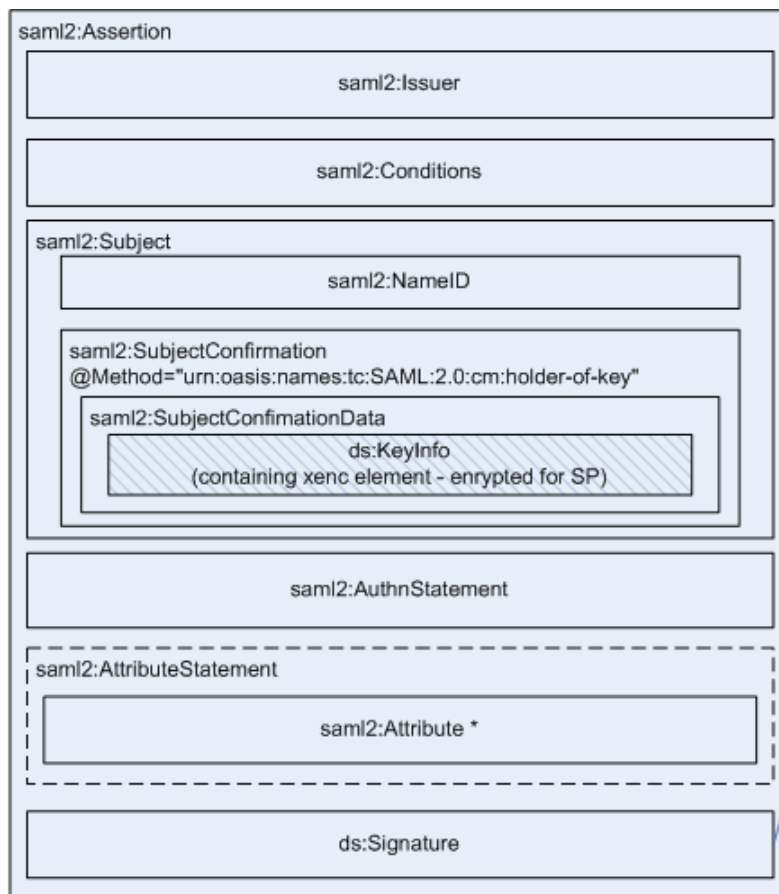

949 MUST be present carrying the entropy value used by the STS for key computation.

950

950 **`/wst:LifeTime ?`**

951

952 Optional element carrying the validity duration period of this RSTR; SHOULD be recognized by the Requestor and processed according to his needs to avoid using security tokens being/getting invalid.

952 **7.5.3 Issued SAML-Token Details**

953

954 Figure 5: SAML 2.0 Assertion constituents

955 Short description of the constituents of a `/saml2:Assertion`, for XML Infoset details see [SAML2]
 956 ¹⁷and [SAMLAC]. The concrete token request requirements and layout of issued token at least has to
 957 be matched with the capabilities of the used STS instances. For implementations to be operated in
 958 context of the German administration it is strongly RECOMMENDED to follow requirements and
 959 recommendations given by the concept [SAFE].

960 `/saml2:Issuer`961 Attributes of the STS issuing this assertion; for details see `saml2:NameIDType`962 `/saml2:Conditions`

963 **R0730:** Detailed validity conditions element MUST be present; for details see
 964 `saml2:ConditionsType`. MUST at least outline the validity period attributes
 965 `NotBefore`, `NotOnOrAfter`.

966 `/saml2:Subject`

967 **R0740:** Presence of this element is REQUIRED. The subelements of this container
 968 provide STR identification details.

969 `/saml2:Subject/saml2:NameID`

970 Attributes of the STR; for details see `saml2:NameIDType`. It MUST at least contain a
 971 unique string identifying the STR.

972 `/saml2:Subject/saml2:SubjectConfirmation`

¹⁷ For brevity, we only illustrate the SAML Version 2.0 Assertion in this document. For the SAML Version 1.1 Assertion layout, see [SAML1]

- 973 This container exposes STS information for the SP enabling it to assure the SR is the one
974 stated in `/saml2:NameID` and authorized to use this token.
- 975 `/saml2:Subject/saml2:SubjectConfirmation/@Method`
- 976 **R0750:** Attribute outlining the confirmation method; MUST be the "holder of key"
977 confirmation method.
- 978 `/saml2:Subject/saml2:SubjectConfirmation/saml12:SubjectConfirmationData`
- 979 **R0760:** Presence of this element is REQUIRED; it exposes STS information for the SP
980 enabling it to assure the SR is the one owning key for this SAML assertion.
- 981 `/saml2:Subject/saml2:SubjectConfirmation/saml12:SubjectConfirmationData/ds:`
982 `key`
- 983 **R0770:** This element MUST carry the key in a `xenc:EncryptedKey` element. The key
984 MUST be encrypted for the SP using the public key of its X.509v3 encryption certificate,
985 which for this purpose MUST be made available to the STS.
- 986 NOTE on the endpoint encryption certificate the SAML token is targeted to:
987 The access to this certificate through the token issuing STS is of band of this specification;
988 this is a matter of Trust Domain policies and an implementation issue which MUST have
989 no effect on interoperability. No standardized mechanisms are foreseen by WS-Trust, to
990 include a certificate in a RST message for the purpose of key encryption for the SP. It is
991 strongly RECOMMENDED, to relate the `/wsp:AppliesTo` request value (which might
992 be a pattern, too – see RST body description in chapter [7.5.2.1]) to this encryption
993 certificate.
- 994 `/saml2:AuthnStatement`
- 995 **R0780:** Presence of this element is REQUIRED.
- 996 It MUST contain an element `/saml2:AuthnContext` with an attribute `@AuthnInstant`
997 outlining the time instant the authentication took place.
- 998 `/saml2:AuthnContext` MUST contain an element `/saml2:AuthnContextClassRef`
999 outlining the authentication method used by the SR.¹⁸
- 1000 `/saml2:AuthnContext` MUST further contain an element
1001 `/saml2:AuthnContextDecl` carrying the extensions for authentication strongness as
1002 defined in chapter [7.5.1].
- 1003 `/saml2:AttributeStatement ?`
- 1004 Usage of attribute statements of type `saml12:AttributeType` is RECOMMENDED. In
1005 many scenarios subject attributes like affiliation to certain groups or roles are used for the
1006 assignment detailed rights, functions and data access. Hence attributes are specific to
1007 application scenarios, their names, values and semantics are subject to the overall design
1008 of a domain information model, which is not addressed by this specification.¹⁹
- 1009 `/ds:Signature`
- 1010 The issuing STS has to sign the whole SAML-Token.

¹⁸ See [SAMLAC] and [SAFE] for details; i.e. a X509v3 certificate from a smartcard was used for authentication, the value would be `urn:oasis:names:tc:2.0:ac:classes:SmartcardPKI`

¹⁹ Suggestions for use in German eGovernment, especial eJustice, are made in [SAFE]

1011 If a SAML token does not match one or more of the formal requirements 0730-0780, the token
1012 consuming node **MUST** generate a fault and discard the message.

1013 **Fault 7: AuthnTokenFormalMismatch**

1014 [Code] Sender

1015 [Subcode] AuthnTokenFormalMismatch

1016 [Reason] Authentication token present does not match formal requirements.

1017 More information **MAY** be given in the fault [Details] property, but care should be taken to introduce
1018 security vulnerabilities by providing too detailed information.

1019 **7.5.4 Authentication for Foreign Domain Access**

1020 To authenticate and authorize access to foreign TD endpoints, these endpoints **MUST** be able to
1021 validate the SAML-Token contained in the message. The specification WS-Federation 1.1 ([WSF],
1022 chapter 2.4) outlines several possible trust topologies; for simplification, two of those described below
1023 are selected to be applicable for this version of the OSCI specification.

1024 A new version 1.2 of WS-Federation is about to be approved by the OASIS WSFED Technical
1025 Committee while publishing the here presented version of OSCI Transport. WS-Federation 1.2 will be
1026 incorporated in a follow-up of OSCI Transport. So far, the WS Federation metadata model is not yet
1027 been taken in account for usage in OSCI 2.0 based infrastructures.

1028 Precondition for cross domain message exchange is an established trust relationship between the
1029 Initiators STS and the one of the foreign TD. This i.e. can be achieved by trust in the STS signature
1030 using its signing certificate as a trust anchor.

1031 One useable trust model is, a SAML-Token issued by the foreign STS must be aquired for accessing
1032 endpoints in this TD. Authentication at foreign STS in this case is obtained on base of presenting the
1033 SAML-Token of the Initiators STS in the according RST issue message. Depending on policies in
1034 effect, this SAML-Token may be replaced or cross-certified by applying a new signature. The SAML-
1035 Token key **MUST** be encrypted for the endpoint access is intended for. At the endpoint accessed,
1036 SAML-Token validation can be done on base of the signature of the foreign TD STS.

1037 In the second trust model, the SAML-Token issued by the Initiator's STS directly is used for access
1038 authentication. In this case, the foreign endpoint points a RST validate message to his trusted STS for
1039 validating the foreign SAML-Token – what there again is done on base of SAML-Token signature,
1040 which must be trusted by the validating STS. Again, the SAML-Token key **MUST** be encrypted for the
1041 endpoint access it is intended for.

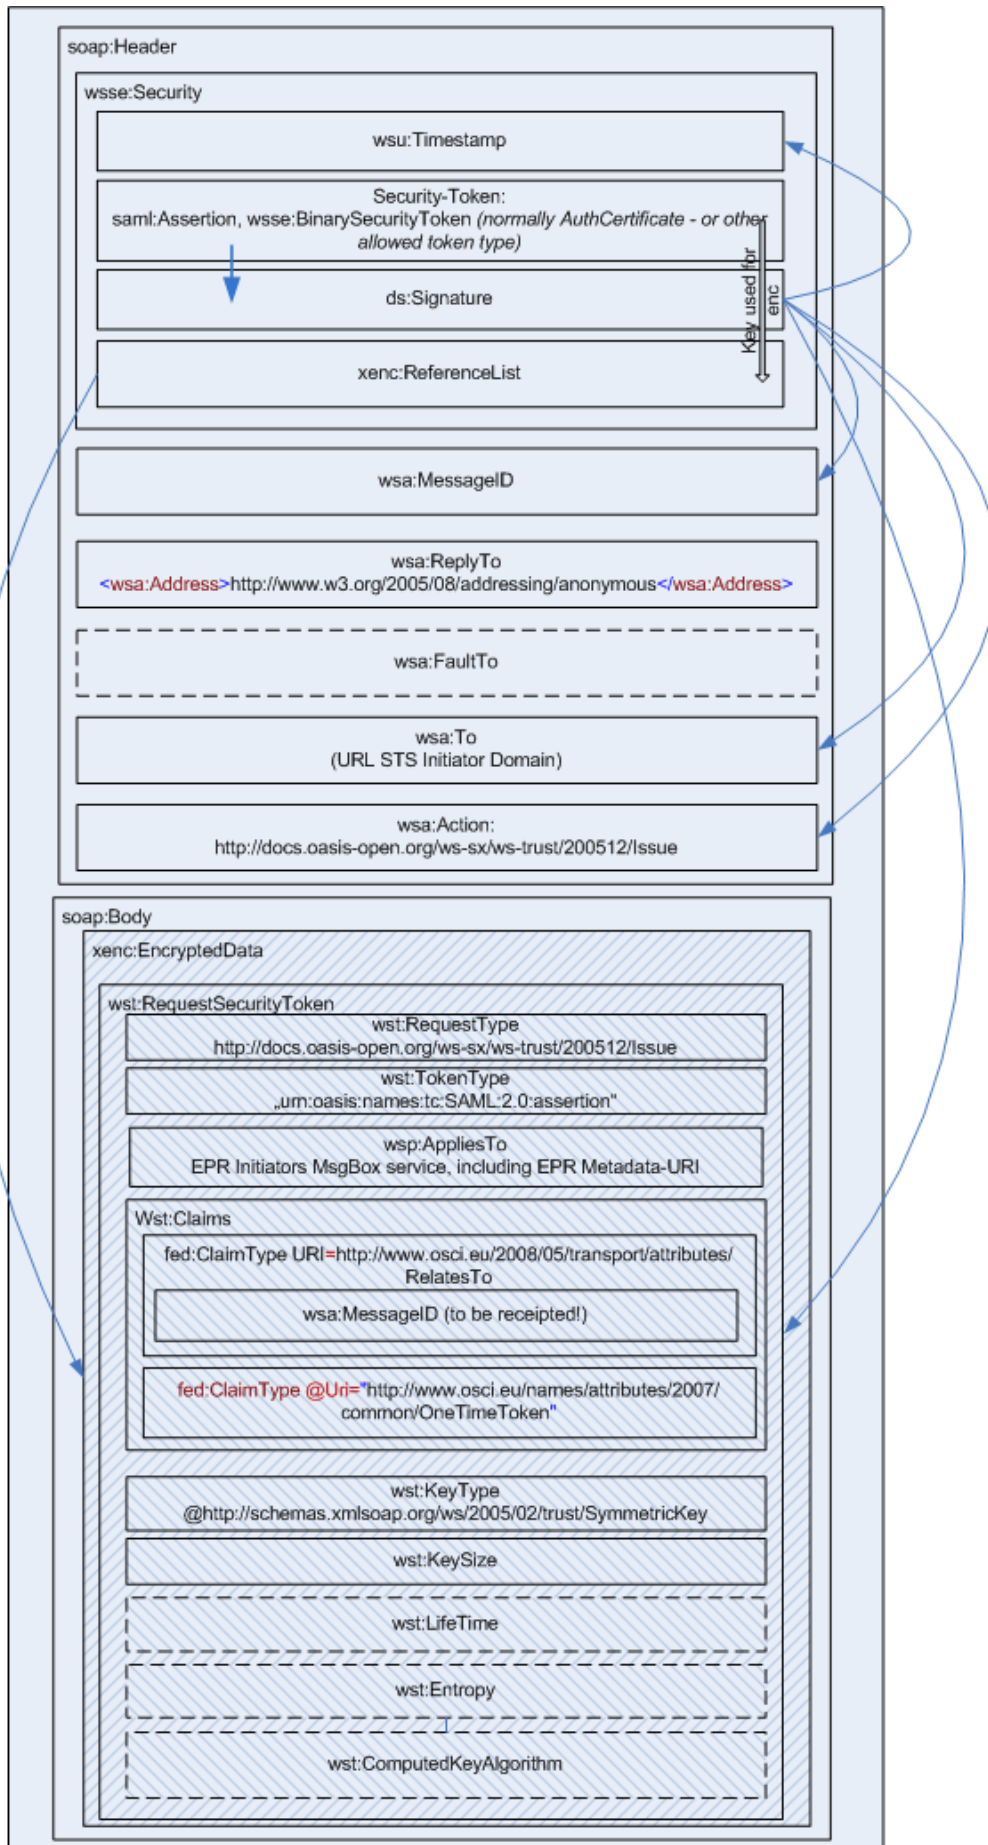

1042 Details of the required SAML Token including claims and the issuing STS address as well as public
1043 key of this STS encryption certificate **SHOULD** be exposed by the endpoint WSDL. Apart, means of
1044 WS-Trust as already outlined in the chapters above apply.

1045 **7.5.5 SAML-Token for Receipt- /Notification Delivery**

1046 Requested receipts and notifications which cannot be delivered in the network backchannel of a
1047 request message **MUST** be delivered using an independent request message asynchronously to the
1048 EPR outlined in the receipt/notification request – which in general **SHOULD** be the Initiators MsgBox.
1049 As – like for all messages - delivery of receipts/notifications to this EPR requires authentication and
1050 authorization, an according SAML-Token **SHOULD** be forwarded to the receipt/notification generating
1051 node together with the request for it. This mechanism disburdens these nodes from the acquisition of
1052 an extra SAML-Token to authenticate receipt/notification delivery.

1053 This type of SAML-Token - referred to as "**OneTimeToken**" - is valid only for "one time use" of
1054 receipt/notification delivery and bound to the `wsa:MessageID` of the message to be
1055 receipted/notified. Following rules apply:

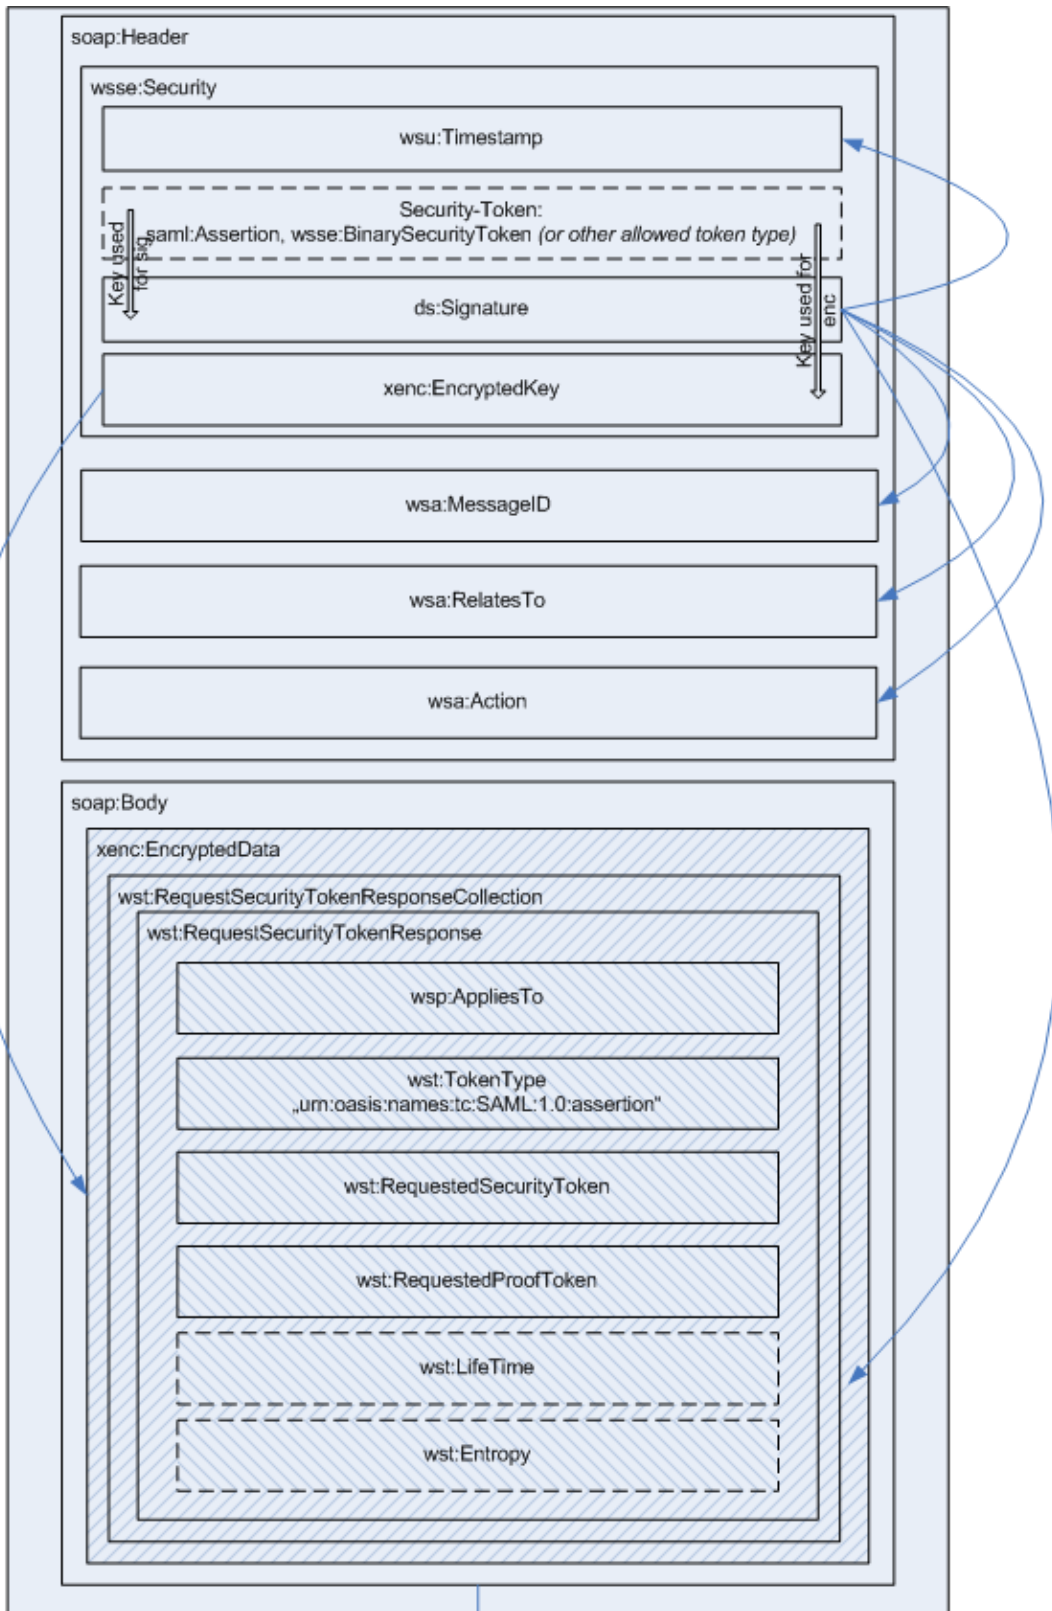

- 1056 1. It MUST be requested from the Initiators's STS.
- 1057 2. The according RST message MUST contain the **wsa:MessageID** and the address of the
1058 receiving/notifying node (**wsp:AppliesTo**) as claims.
- 1059 3. The symmetric key of the issued SAML-Token MUST be encrypted for the endpoint outlined in
1060 the element **.../wsa:ReplyTo** of the receipt/notification demand; the
1061 **wst:RequestedProofToken** in this case MUST be encrypted for receiving/notifying node
1062 (for use in step 6. ahead)
- 1063 4. The issuing STS MUST retain this OneTimeToken for later use and mark it as "unused".
- 1064 5. The RSTR message returned by the STS MUST be included as separate SOAP header block
1065 in the request message.
- 1066 6. The receiving/notifying node has to use the OneTimeToken included in this RSTR as SAML-
1067 Token for the message the receipt/notification is delivered with. Transport signature and
1068 encryption MUST be generated on base of the symmetric key contained in the
1069 **wst:RequestedProofToken**.
- 1070 Steps to be done by the node this message is targeted to:
- 1071 7. Decryption of the OneTimeToken's symmetric key.
- 1072 8. Validation of the signature of the OneTimeToken – the symmetric key MUST be the same the
1073 receiving/notifying node used for the transport signature.
- 1074 9. Validation of the signature of the issuing STS and RST-Validate message containing the
1075 OneTimeToken to the STS.
- 1076 10. If at the issuing STS this OneTimeToken is still marked as "unused", the token is is valid.
- 1077 11. If RSTR in validate-response signals valid: Acceptance of the message containing the
1078 receipt/notification.
- 1079 12. Message accpeting node MUST target a RST/cancel message to the STS to invalidate this
1080 OneTimeToken; STS SHOULD discard this token.
- 1081 Following diagrams illustrate the RST and RSTR for the OneTimeToken, for concrete XML Infoset
1082 descriptions see WS-Trust and SAML specifications.

1083

1087 8 OSCI specific Extensions

1088 8.1 Message Flow Time Stamping

1089 For sake of traceability of message flow time instants and delivery status, every message of type
 1090 osci:Request MAY contain following SOAP header block, which child elements are provided
 1091 depending on the nodes passed in the message flow.

```
1092 <osci:MsgTimeStamps wsu:Id="..." ? >
1093   <osci:ObsoleteAfter> xs:date </osci:ObsoleteAfter> ?
1094   <osci:Delivery> xs:dateTime </osci:Delivery> ?
1095   <osci:InitialFetch> xs:dateTime </osci:InitialFetch> ?
1096   <osci:Reception> xs:dateTime </osci:Reception> ?
1097 </osci:MsgTimeStamps>
```

1098 Description of elements and attributes in the schema overview above:

1099 **/osci:MsgTimeStamps**

1100 This complex element is the container for various optional timestamp elements. It MUST
 1101 be created from the first node on the message flow which applies one or more sub-
 1102 elements.

1103 **/osci:MsgTimeStamps/@wsu:Id**

1104 For ease of referencing this SOAP header block from WS Security SOAP header
 1105 elements, this attribute of type `wsu:Id` SHOULD be provided.

1106 **/osci:MsgTimeStamps/osci:ObsoleteAfter ?**

1107 This element of type `xs:date` MAY be provided by an Initiator to denote the date after
 1108 which a message is to be seen as obsolete for delivery and/or consumption. It MUST NOT
 1109 be provided or changed by other nodes on the message path.

1110 If and how this information is handled by this endpoint this message is targeted to if
 1111 outlined in the policy of this endpoint; see chapter [10.2.2] for details.

1112 **/osci:MsgTimeStamps/osci:Delivery ?**

1113 This element of type `xs:dateTime` MUST be provided by a MsgBox node when
 1114 accepting an incoming message and MUST to be set to the value of the actual MsgBox
 1115 server time.

1116 It MUST NOT be provided or changed by other nodes on the message path.

1117 **/osci:MsgTimeStamps/osci:InitialFetch ?**

1118 This element of type `xs:dateTime` MUST be provided by a MsgBox node with to the
 1119 value of the actual MsgBox server time when an authorized Recipient initially pulls the
 1120 message from his MsgBox instance. commits the successful initial reception of this
 1121 message. This SHOULD be done by a Recipient after the first successful pulling of the
 1122 message from his MsgBox.

1123 It MUST NOT be provided or changed by other nodes on the message path. Pull
 1124 processes on the same message following a first confirmed one, this element MUST NOT
 1125 be updated.

1126 **/osci:MsgTimeStamps/osci:Reception ?**

1127 This element of type `xs:dateTime` MAY be set by a Recipient to his actual server time
 1128 when successfully accepting an incoming message, but it should be considered that the

1129 signature is invalidated which was applied over SOAP header and body elements by the
1130 message issuing instance.

1131 It MUST be set by a MsgBox node to his actual server time when the recipient commits
1132 the reception of a message thri a MsgBoxGetNextRequest or MsgBoxCloceRequest.

1133 It MUST NOT be provided or changed on the message path by other nodes than
1134 described here.

1135 8.2 Accessing message boxes

1136 Following chapters define how to access MsgBox services for searching and pulling out messages as
1137 well as how to gain status lists describing content of message boxes. Statuses of those requests are
1138 delivered in the SOAP header block of the correlating responses, while the pulled messages
1139 respective status lists are delivered in the SOAP body block.

1140 We describe the requests first, followed by the respective responses and additional messages to
1141 model "get next", "commit" and "close" semantics for iterative MsgBox access sequences.

1142 8.2.1 MsgBoxFetchRequest

1143 To request a message from an endpoint, a requestor MUST send a MsgBoxFetchRequest message to
1144 his MsgBox instance endpoint.

1145 The normative outline for a MsgBoxFetchRequest request is:

```
1146 <s12:Envelope ...>
1147   <s12:Header ...>
1148     ...
1149     <wsa:Action>
1150     http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxFetchRequest
1151     </wsa:Action>
1152     <wsa:MessageID>xs:anyURI</wsa:MessageID>
1153     <wsa:To>xs:anyURI</wsa:To>
1154     <osci:TypeOfBusinessScenario wsa:IsReferenceParameter="1">
1155       xs:anyURI
1156     </osci:TypeOfBusinessScenario>
1157     ...
1158   </s12:Header>
1159   <s12:Body ...>
1160     <osci:MsgBoxFetchRequest>
1161       <osci:MsgSelector newEntry=("true" | "false")>
1162         <wsa:MessageID> xs:anyURI </wsa:MessageID> *
1163         <wsa:RelatesTo> xs:anyURI </wsa:RelatesTo> *
1164         <osci:MsgBoxEntryTimeFrom>
1165           xs:dateTime
1166         </osci:MsgBoxEntryTimeFrom> ?
1167         <osci:MsgBoxEntryTimeTo> xs:dateTime </osci:MsgBoxEntryTimeTo> ?
1168         <osci:Extension> xs:anyType </osci:Extension> ?
1169       </osci:MsgSelector> ?
1170     </osci:MsgBoxFetchRequest>
1171   </s12:Body>
1172 </s12:Envelope>
```

1173 The following describes normative constraints on the outline listed above:

1174 **/s12:Envelope/s12:Header/wsa:Action**

1175 The value indicated herein MUST be used for that URI.

1176 **/s12:Envelope/s12:Header/wsa:MessageID**

1177 The request MUST carry a unique WS-Addressing MessageID.

- 1178 **/s12:Envelope/s12:Header/wsa:To**
- 1179 The address of the MsgBox (request destination) endpoint.
- 1180 **/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario**
- 1181 This value of the instantiation of **/wsa:ReferenceParameters** MUST be supplied for
 1182 this message type. The value of **/osci:TypeOfBusinessScenario** is taken as
 1183 message selection argument and SHOULD match one of those accepted by this endpoint.
 1184 If a **MsgBoxFetchRequest** contains no other arguments for message selection in the
 1185 SOAP body element **osci:MsgBoxFetchRequest/osci:MsgSelector**, the
 1186 messages to be selected MUST be those which have not yet been fetched. Those are all
 1187 messages in the addressed **MsgBox** which have no SOAP header element or a value of
 1188 zero in the time instant element **.../osci:MsgTimeStamps/osci:InitialFetched**.
 1189 They MUST be delivered one per request-/ response in a FIFO-manner to the endpoint
 1190 denoted by **/s12:Envelope/s12:Header/wsa:ReplyTo**.
- 1191 **/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario/**
 1192 **@wsa:IsReferenceParameter**
- 1193 Following WS-Addressing, the element MUST be attributed with
 1194 **@wsa:IsReferenceParameter="1"**
- 1195 The body of this message contains the actual request in a structure
- 1196 **/s12:Envelope/s12:Body/osci:MsgBoxFetchRequest**
- 1197 Container holding detailed selection arguments in addition to
 1198 **/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario** above; this
 1199 element MAY be empty if no further selection criteria shall be provided.
- 1200 **/s12:Envelope/s12:Body/osci:MsgBoxFetchRequest/osci:MsgSelector ?**
- 1201 If this optional element is present, arguments of the attribute **@newEntry** and sub-
 1202 elements **MsgSelector** MUST be processed as logical AND (after first OR-Processing of
 1203 the sequences of **MessageIDs** in the SOAP body elements **.../osci:MessageID** and
 1204 **.../osci:RelatesTo**, if present).
- 1205 **/s12:Envelope/s12:Body/osci:MsgBoxFetchRequest/osci:MsgSelector/@newEntry ?**
- 1206 This optional boolean attribute is defaulted to a value of true, if not present. If present, this
 1207 attribute denotes whether only already pulled or new entered messages have to be
 1208 selected from the **MsgBox**. "New" messages are indicated by having no SOAP header
 1209 element or a value of zero in the time instant element
 1210 **.../osci:MsgTimeStamps/osci:InitialFetched**.
- 1211 **/s12:Envelope/s12:Body/osci:MsgBoxFetchRequest/osci:MsgSelector/**
 1212 **osci:MessageID ***
- 1213 If present, this element contains a sequence of WS-Addressing **MessageIDs**. By including
 1214 this element the request a **MsgBox** service MUST limit its search to just those messages
 1215 with these values in the WS-Addressing SOAP header element **.../wsa:MessageID**.
- 1216 **/s12:Envelope/s12:Body/osci:MsgBoxFetchRequest/osci:MsgSelector/**
 1217 **osci:RelatesTo ***
- 1218 If present, this element contains a sequence of WS-Addressing **MessageIDs**. By including
 1219 this element the request a **MsgBox** service MUST limit its search to just those messages
 1220 with these values in the WS-Addressing SOAP header elements **.../wsa:RelatesTo**.
- 1221 **/s12:Envelope/s12:Body/osci:MsgBoxFetchRequest/osci:MsgSelector/**
 1222 **osci:MsgBoxEntryTimeFrom ?**

1223 If present, this element denotes a value of type `xs:dateTime` as lower value when a
 1224 message has been accepted by a `MsgBox` service. The resulting search expression is
 1225 `.../osci:MsgBoxEntryTimeFrom >=` the value of `.../osci:Delivery` in the message
 1226 SOAP header block `osci:MsgTimeStamps` if the correlated element
 1227 `.../osci:MsgBoxEntryTimeTo` is not present in `.../osci:MsgSelector`.

1228 `/s12:Envelope/s12:Body/osci:MsgBoxFetchRequest/osci:MsgSelector/
 1229 osci:MsgBoxEntryTo ?`

1230 If present, this element denotes a value of `xs:dateTime` as upper value when a
 1231 message has been accepted by a `MsgBox` services. The resulting search expression is
 1232 `.../osci:MsgBoxEntryTimeTo <=` the value of `.../osci:Delivery` in the message
 1233 SOAP header block `osci:MsgTimeStamps` if the correlated element
 1234 `.../MsgBoxEntryTimeFrom` is not present in `.../osci:MsgSelector`.

1235 If latter elements both are set, the resulting search expression is
 1236 `.../osci:MsgBoxEntryFrom >= .../osci:Delivery <=`
 1237 `.../osci:MsgBoxEntryTimeTo`; the value of `.../osci:MsgBoxEntryFrom` MUST be
 1238 less or equal to the value of `.../osci:MsgBoxEntryTo`.

1239 `/s12:Envelope/s12:Body/osci:MsgBoxFetchRequest/osci:MsgSelector/
 1240 osci:Extension/{any} *`

1241 This is an extensibility mechanism to allow other search criteria to be passed. For
 1242 example, an XPath query could be used to search for messages that match a certain
 1243 pattern. Implementations may use this element for defining search criteria on agreements
 1244 outbound to this specification. At some future time this specification will define such an
 1245 extension.

1246 Upon receipt and authentication of this message, the `MsgBox` service MUST locate any message that
 1247 matches the selection criteria. Only messages originally targeted to this EPR MUST be returned. The
 1248 search criteria MUST include examination of the child elements inside the SOAP body element
 1249 `.../osci:MsgSelector`.

1250 Selected messages MUST be given back to the requestor one by one in the response to this request
 1251 in an ascending order given by the values of the SOAP header block element
 1252 `/osci:MsgTimeStamps/osci:Delivery` ("FIFO"). A `MsgBox` service MUST hold the complete
 1253 list corresponding to the selection criteria and deliver an ID for this list to the requestor with the
 1254 response. In subsequent requests (see `MsgBoxGetNextRequest` in chapter [8.2.4]) the Requestor is
 1255 able to pull further messages of a selection result with reference to this list. Remaining messages of
 1256 the complete list MUST be retained for following messages of type `MsgBoxGetNextRequest`.

1257 8.2.2 MsgBoxStatusListRequest

1258 To request a message status list from a `MsgBox` service endpoint, a requestor MUST send a
 1259 `MsgBoxStatusListRequest` message to his `MsgBox` instance endpoint.

1260 The normative outline for a `MsgBoxStatusListRequest` request is akin to the `MsgBoxFetchRequest`:

```
1261 <s12:Envelope ...>
1262 <s12:Header ...>
1263 ...
1264 <wsa:Action>
1265 http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxStatusListRe
1266 quest
1267 </wsa:Action>
1268 <wsa:MessageID>xs:anyURI</wsa:MessageID>
1269 <wsa:To>xs:anyURI</wsa:To>
1270 <osci:TypeOfBusinessScenario wsa:IsReferenceParameter="1">
1271 xs:anyURI
1272 </osci:TypeOfBusinessScenario>
1273 ...
1274 </s12:Header>
```

```

1276 <s12:Body ...>
1277   <osci:MsgBoxStatusListRequest maxListItems="xs:positiveInteger">
1278   <osci:MsgSelector newEntry=("true" | "false")>
1279     <osci:MessageId> xs:anyURI </osci:MessageId> *
1280     <osci:RelatesTo> xs:anyURI </osci:RelatesTo> *
1281     <osci:MsgBoxEntryTimeFrom>
1282       xs:dateTime
1283     </osci:MsgBoxEntryTimeFrom> ?
1284     <osci:MsgBoxEntryTimeTo>
1285       xs:dateTime
1286     </osci:MsgBoxEntryTimeTo> ?
1287     <osci:Extension> xs:anyType </osci:Extension> ?
1288   </osci:MsgSelector> ?
1289 </osci:MsgBoxStatusListRequest>
1290 </s12:Body>
1291 </s12:Envelope>

```

1292 Description of normative constraints on the outline listed above:

1293 **/s12:Envelope/s12:Header/wsa:Action**

1294 The value indicated herein MUST be used for that URI.

1295 **/s12:Envelope/s12:Header/wsa:MessageID**

1296 The request MUST carry a unique WS-Addressing MessageID.

1297 **/s12:Envelope/s12:Header/wsa:To**

1298 The address of the MsgBox (request destination) endpoint.

1299 **/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario**

1300 This value of the instantiation of **/wsa:ReferenceParameters** MUST be supplied for
1301 this message type. The value of **/osci:TypeOfBusinessScenario** is taken as
1302 message selection argument and SHOULD match one of those accepted by this endpoint.
1303 As an alternative in this special case a value of "*" MAY be supplied here, to select the
1304 message status list for all messages in this MsgBox instance. Such an entry entry MUST
1305 lead to a message box status list containing all messages with no regard to a specific
1306 addressed business scenario of this endpoint actually exposes to be able to serve.

1307 Only status lists of messages originally targeted to the EPR outlined MUST be returned. If
1308 a MsgBoxFetchRequest contains no other arguments for message selection in the
1309 OSAPbody element **osci:MsgBoxStatusListRequest**, the messages to be selected
1310 MUST be those which have not yet been fetched. That are all messages in the addressed
1311 MsgBox having no SOAP header element or a value of zero in the
1312 **.../osci:MsgTimeStamps/osci:InitialFetched** time instant element.

1313 **/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario/**

1314 **@wsa:IsReferenceParameter**

1315 Following WS-Addressing, the element MUST be attributed with

1316 **@wsa:IsReferenceParameter="1"**

1317 The body of this message contains the actual request in the structure

1318 **/s12:Envelope/s12:Body/osci:MsgBoxStatusListRequest**

1319 Container holding detailed selection arguments in addition to
1320 **/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario** above; this
1321 element MAY contain no child elements if no further selection criteria shall be provided.

1322 **/s12:Envelope/s12:Body/osci:MsgBoxStatusListRequest/@maxListItems ?**

1323 The requestor MAY limit the length of the message status list he expects in the response
1324 with this attribute of type **xs:positiveInteger**. A MsgBox service MUST hold the

1325 complete list corresponding to the selection criteria and deliver an ID for this list to the
 1326 requestor with the response. In subsequent requests (see `MsgBoxGetNextRequest` in
 1327 chapter [8.2.4]), the requestor is able to request further portions of a selection result with
 1328 reference to this list.

1329 A `MsgBox` instance MAY limit the value of `@maxListItems` to any value greater zero.

1330 If provided, a `MsgBox` instance MUST retain this value – if not decreased by its configured
 1331 limit - together with the result set until the whole result set is delivered to the requestor or
 1332 the requestor cancels an iteration sequence (see `MsgBoxCloseRequest` in chapter [8.2.5].

1333 `/s12:Envelope/s12:Body/osci:MsgBoxStatusListRequest/osci:MsgSelector`

1334 For the content of this complex element, which defines selection criteria for messages,
 1335 see description in last chapter [8.2.1].

1336 `/s12:Envelope/s12:Body/osci:MsgBoxStatusListRequest/osci:MsgSelector/`
 1337 `osci:Extension/{any} *`

1338 This is an extensibility mechanism to allow other search criteria to be passed. See
 1339 respective explanation for `osci:MsgBoxStatusListRequest`.

1340 Upon receipt and authentication of this message, the `MsgBox` service will locate any message that
 1341 matches the selection criteria. Only messages originally targeted to this EPR MUST be selected for
 1342 the required message status list. The search criteria MUST include examination of the child elements
 1343 inside the `/osci:MsgSelector` SOAP body element.

1344 The message status list to be given back to the requestor MUST be of the maximum size denoted by
 1345 `/osci:MsgBoxStatusListRequest/@maxListItems` or a lower size according to possible
 1346 configured restrictions of the requested `MsgBox` instance. The list MUST be build up and sorted in an
 1347 ascending order given by the message SOAP header block element
 1348 `/osci:MsgTimeStamps/osci:Delivery` ("FIFO"). Remaining items of the complete list not
 1349 deliverable to the requestor directly in the response to the initial `MsgBoxStatusListRequest` MUST be
 1350 retained for following messages of type `MsgBoxGetNextRequest`.

1351 8.2.3 MsgBoxResponse

1352 Request messages `MsgBoxFetchRequest` und `MsgBoxStatusListRequest` are both responded by the
 1353 same status information in the SOAP header block of the response, only the body parts differ as
 1354 outlined in the following chapters.

1355 **NOTE:** It is strongly recommended to encrypt the SOAP body block of a `MsgBoxResponse` using the
 1356 Recipients's X509 encryption certificate.

1357 The normative outline for a `MsgBoxResponse` header is:

```

1358 <s12:Envelope ...>
1359 <s12:Header ...>
1360 ...
1361 <wsa:Action>
1362 http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxResponse
1363 </wsa:Action>
1364 <wsa:MessageID>xs:anyURI</wsa:MessageID>
1365 <wsa:FaultTo> wsa:EndpointReference </wsa:FaultTo> ?
1366 ...
1367 <osci:MsgBoxResponse MsgBoxRequestID="xs:anyURI"
1368 wsu:Id = "xs:ID" ?
1369 <osci:NoMessageAvailable
1370 reason=
1371 ( "http://www.osci.eu/ws/2008/05/transport/MsgBox/reasons/NoMatch"
1372 |
1373 "http://www.osci.eu/ws/2008/05/transport/MsgBox/reasons/SearchArgsInvalid"
1374
```

```

1375 |
1376 | "http://www.osci.eu/ws/2008/05/transport/MsgBox/reasons/RequestIdInvalid"
1377 | | "xs:anyUri" />
1378 | |
1379 | | <osci:ItemsPending>
1380 | | | xs:positveInteger
1381 | | </osci:ItemsPending>
1382 | | </osci:MsgBoxResponse>
1383 | | ...
1384 | </s12:Header>
1385 | <s12:Body ...>
1386 |
1387 | </s12:Body>
1388 | </s12:Envelope>

```

1389 Description of normative constraints on the outline listed above (WS-Addressing header elements are
1390 to be handled according to chapter [6, Addressing Endpoints]):

1391 **/s12:Envelope/s12:Header/wsa:Action**

1392 The value indicated herein MUST be used for that URI.

1393 **/s12:Envelope/s12:Header/wsa:MessageID**

1394 The request MUST carry a unique WS-Addressing MessageID.

1395 **/s12:Envelope/s12:Header/wsa:FaultTo ?**

1396 The optional Endpoint Reference (EPR) SOAP fault messages should be routed to.

1397 **/s12:Envelope/s12:Header/osci:MsgBoxResponse**

1398 The container for the status response; the status response is a choice of two alternatives,
1399 depending on request fulfilment.

1400 Following attributes MUST be set:

1401 **/s12:Envelope/s12:Header/osci:MsgBoxResponse/@MsgBoxRequestID**

1402 This mandatory element of type **xs:anyURI** MUST carry a unique value of type UUID
1403 according to [RFC4122]. It serves to identify messages of type **MsgBoxFetchRequest** and
1404 **MsgBoxStatusListRequest** and MUST be used by the Requestor in subsequent messages
1405 of type **MsgBoxGetNextRequest** or **MsgBoxCloseRequest** explained below. The value
1406 MUST be generated by a **MsgBox** instance for every incoming **MsgBoxFetchRequest** or
1407 **MsgBoxStatusListRequest** and MUST be retained and correlated to these requests with
1408 their individual search criteria.

1409 **/s12:Envelope/s12:Header/osci:MsgBoxResponse/@wsu:Id ?**

1410 For ease of referencing this SOAP body block, this optional attribute of type **wsu:Id** MAY
1411 be provided.

1412 **/s12:Envelope/s12:Hedader/osci:MsgBoxResponse/osci:NoMessageAvailable**

1413 This element of the choice of **.../MsgBoxResponse** MUST be set if

1414 there are no messages available corresponding to the selection criteria

1415 there where errors detected in the selection criteria.

1416 The element carries following attribute:

1417 **/s12:Envelope/s12:Header/osci:MsgBoxResponse/osci:NoMessageAvailable/**

1418 **@reason**

1419 Attribute of type **xs:anyURI**, identifies the reason of **/osci:NoMessageAvailable** set
1420 with following defined meanings:

@reason URI	Meaning
http://www.osci.eu/ws/2008/05/transport/MsgBox/reasons/NoMatch	No messages matching the search criteria could be found
http://www.osci.eu/ws/2008/05/transport/MsgBox/reasons/SearchArgsInvalid	Error contained in search arguments
http://www.osci.eu/ws/2008/05/common/urn/MsgBox/reasons/RequestIdInvalid	RequestId of subsequent GetNext- Close- Request is not known or no longer available at the MsgBox instance
Any other URI	Specific other reasons MAY be defined by implementations

1421 Table 8: Predefined business scenario types

1422 The alternate of the choice of `.../MsgBoxResponse` MUST be set if there are – according to the
 1423 selection criteria of the request - messages or message status list items pending (not yet deliverable
 1424 to the requestor in the actual response):

1425 `/s12:Envelope/s12:Header/osci:MsgBoxResponse/osci:ItemsPending`

1426 This element of type `xs:nonNegativeInteger` MUST be set with the number of the
 1427 remaining items. If the last portion of a result set delivered to the requestor with this actual
 1428 response, the value MUST be set to zero to signal this fact.

1429 **8.2.3.1 MsgBoxResponse - body to MsgBoxFetchRequest**

1430 For this type of foregoing initial request, the requested message MUST be delivered in following
 1431 manner:

- 1432 • A SOAP Envelope with all child elements MUST be build up containing a header block with
 1433 the ones of the original message except header elements which had initially been targeted to
 1434 and successfully executed by the MsgBox node as well as the transport encryption and
 1435 signature elements which had been supplied by the Initiator of this message.
- 1436 • The SOAP header element `osci:MsgTimeStamps` MUST be inserted (or completed, if
 1437 present) as described in chapter [8.1].
- 1438 • All original WS-Addressing, `osci:X509TokenContainer`, `xkms:ValidateResult` (inside
 1439 a `xkms:CompoundResult`) and original Security Token and WS-Trust header elements
 1440 MUST be included.
- 1441 • If present in the original message, the `osci:ReceptionReceiptDemand` header element
 1442 MUST be included.
- 1443 • The original SOAP body child elements MUST be included unchanged as child elements of
 1444 the SOAP body of this SOAP Envelope to be build up.
- 1445 • The Recipient may have interest in the authentication and authorization data originally carried
 1446 in the SOAP WS Security header when delivering a message to the Recipients MsgBox.
 1447 Therefore, this security token MUST be inserted as additional child element in the SOAP
 1448 header of this SOAP Envelope to be built up.

1449 The resulting SOAP envelope MUST be included as child element of the SOAP body block of the
1450 response message.

1451 **8.2.3.2 MsgBoxResponse - body to MsgBoxStatusListRequest**

1452 For this type of foregoing initial request, the requested list MUST be build up in the SOAP body block
1453 of the response message. This is the same for responses to subsequent requests of type
1454 MsgBoxGetNextRequest (see MsgBoxGetNextRequest in chapter [8.2.4]).

1455 The normative outline for a MsgStatusList is:

```
1456 <osci:MsgStatusList>
1457   <osci:MsgAttributes>
1458     <wsa:MessageID>xs:anyUri</wsa:MessageID>
1459     <wsa:RelatesTo>xs:anyUri</wsa:RelatesTo> *
1460     <wsa:From>endpoint-reference</wsa:From> ?
1461     <osci:TypeOfBusinessScenario>xs:anyUri</osci:TypeOfBusinessScenario>
1462     <osci:MsgSize>xs:positiveInteger</osci:msgSize>
1463     <osci:ObsoleteAfterDate> xs:date </osci:ObsoleteAfterDate> ?
1464     <osci:DeliveryTime> xs:dateTime </osci:DeliveryTime>
1465     <osci:InitialFetchTime> xs:dateTime </osci:InitialFetchTime> ?
1466   </osci:MsgAttributes> *
1467 </osci:MsgStatusList>
```

1468 The whole structure MUST be positioned under `/s12:Envelope/s12:Body`.

1469 `/osci:MsgStatusList`

1470 Container for the items of the list.

1471 `/osci:MsgStatusList/osci:MsgAttributes *`

1472 The container for the attributes of one message of the status list. The number of
1473 occurrences is determined by the number of items of selection result list not yet delivered
1474 to the requestor and the value of
1475 `.../osci:MsgBoxStatusListRequest/@maxListItems` of the initial
1476 MsgBoxStatusListRequest, which MAY be modified to a lower value greater zero set by
1477 the requested MsgBox instance.

1478 `/osci:MsgStatusList/osci:MsgAttributes/wsa:MessageID`

1479 MessageID of the message, derived from respective header element.

1480 `/osci:MsgStatusList/osci:MsgAttributes/wsa:RelatesTo *`

1481 MessageIDs of related messages of the message, derived from respective header
1482 elements, if present there they MUST be included in `/osci:MsgStatusList`.

1483 `/osci:MsgStatusList/osci:MsgAttributes/wsa:From ?`

1484 Optional emelemt, From-EPR of the message, derived from the respective header
1485 element, if present there it MUST be included in `/osci:MsgStatusList`.

1486 `/osci:MsgStatusList/osci:MsgAttributes/osci:TypeOfBusinessScenario`

1487 This URI denotes the type of addressed business scenario of the intended recipient of the
1488 message. It is derived from the `/wsa:ReferenceParameters`
1489 `/osci:TypeOfBusinessScenario` associated to the WS-Addressing SOAP header
1490 element `/wsa:To` of the message.

1491 `/osci:MsgStatusList/osci:MsgAttributes/osci:MsgSize`

1492 The size of the message in kilobytes has to be supplied here as `xs:positiveInteger`.

1493 Following timestamps are provided in an `osci:MsgStatusList` according to the

1494 `/osci:MsgTimeStamps` described in chapter [8.1]:

1495 `/osci:MsgStatusList/osci:MsgAttributes/ObsoleteAfterDate ?`

- 1496 Optional element of type `xs:date`, contains - if present in the underlying message - the
 1497 value of the SOAP header block element
 1498 `/osci:MsgTimeStamps/osci:ObsoleteAfter` present in the underlying message.
- 1499 `/osci:MsgStatusList/osci:MsgAttributes/DeliveryTime`
- 1500 This element of type `xs:dateTime` contains the value of the SOAP header block element
 1501 `.../osci:MsgTimeStamps/osci:Delivery`, which MUST be present in a message
 1502 stored by a `MsgBox` instance.
- 1503 `/osci:MsgStatusList/osci:MsgAttributes/InitialFetchedTime ?`
- 1504 This optional element of type `xs:dateTime` contains the value of the SOAP header block
 1505 element `.../osci:MsgTimeStamps/osci:InitialFetch`, which MAY be present in a
 1506 message stored by a `MsgBox` instance. Only if not present or present with a value of zero,
 1507 the `MsgBox` instance MUST provide this element with his actual server time before
 1508 message delivery.

1509 8.2.4 MsgBoxGetNextRequest

1510 To request subsequent, not yet delivered results from foregoing requests of type
 1511 `MsgBoxStatusListRequest` or `MsgBoxFetchRequest`, a requestor MUST send a
 1512 `MsgBoxGetNextRequest` message to the same `MsgBox` instance.

1513 The normative outline for a `MsgBoxGetNextRequest`:

```

1514 <s12:Envelope ...>
1515   <s12:Header ...>
1516     ...
1517     <wsa:Action>
1518       http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/
1519       MsgBoxGetNextRequest
1520     </wsa:Action>
1521     <wsa:MessageID>xs:anyURI</wsa:MessageID>
1522     <wsa:To>xs:anyURI</wsa:To>
1523     <osci:TypeOfBusinessScenario wsa:IsReferenceParameter="1">
1524       xs:anyURI
1525     </osci:TypeOfBusinessScenario>
1526
1527     ...
1528   </s12:Header>
1529   <s12:Body ...>
1530     <osci:MsgBoxGetNextRequest MsgBoxRequestID="xs:anyURI">
1531       <osci:LastMsgReceived wsa:MessageID </osci:LastMsgReceived> *
1532     </osci:MsgBoxGetNextRequest>
1533   </s12:Body>
1534 </s12:Envelope>
  
```

1535 Description of normative constraints on the outline listed above:

1536 `/s12:Envelope/s12:Header/wsa:Action`

1537 The value indicated herein MUST be used for that URI.

1538 `/s12:Envelope/s12:Header/wsa:MessageID`

1539 The request MUST carry a unique WS-Addressing MessageID.

1540 `/s12:Envelope/s12:Header/wsa:To`

1541 The address of the `MsgBox` (request destination) endpoint.

1542 `/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario`

1543 The corresponding value of the initial `MsgBoxFetchRequest` or `MsgBoxStatusListRequest`
 1544 MUST be supplied for this message type.

1545 `/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario/`

1546 `@wsa:IsReferenceParameter`

1547 Following WS-Addressing, the element MUST be attributed with
1548 `@wsa:IsReferenceParameter="1"`

1549 The body of this message contains the actual
1550 `/s12:Envelope/s12:Body/osci:MsgBoxGetNextRequest.`

1551 `/s12:Envelope/s12:Body/osci:MsgBoxGetNextRequest/@MsgBoxRequestID`

1552 This attribute of type `xs:anyURI` MUST be provided with the value of the with this
1553 message referenced foregoing `MsgBoxResponse/@MsgBoxRequestID`. The MsgBox
1554 service MUST use it to correlate this `MsgBoxGetNextRequest` to the initial
1555 `MsgBoxFetchRequest` respective `MsgBoxStatusListRequest`.

1556 `/s12:Envelope/s12:Body/osci:MsgBoxGetNextRequest/osci:LastMsgReceived *`

1557 These optional elements of type `wsa:AttributedURIType` MAY be provided, when the
1558 underlying initial request was of the type `MsgBoxFetchRequest`. The requestor SHOULD
1559 provide here the value(s) of the `/wsa:MessageID` of the last message(s) he received in
1560 the body of the foregoing response(s) to commit successful reception of those messages.
1561 This has to be realized as "reception acknowledge by requester" by the `MsgBox` instance:
1562 If the SOAP header element `.../osci:MsgTimeStamps/osci:Reception` is absent or
1563 the value of the SOAP header element `.../osci:MsgTimeStamps/osci:Reception` is
1564 zero, the actual server time of the `MsgBox` instance MUST now be set here and the value
1565 has to be signed according to chapter [8.1]. The resulting changes in the SOAP header
1566 block `/osci:MsgTimeStamps` now MUST be persisted in the `MsgBox` store.

1567 Upon receipt and authentication of this message, the `MsgBox` service MUST – depending on type of
1568 initial request referenced by `osci:MsgBoxGetNextRequest/@MsBoxRequestID`

- 1569 – deliver a `MsgBoxResponse` with the next message of the list indicated by
1570 `/osci:MsgBoxResponse/@MsBoxRequestID` in the body of the response (rules denoted
1571 in chapter [8.2.3.1] apply)
- 1572 – deliver a `MsgBoxResponse` with the next portion of a `/osci:MsgStatusList` indicated by
1573 `/osci:MsgBoxResponse/@MsBoxRequestID` in the body of the response (rules denoted
1574 in chapter [8.2.3.2] apply).

1575 Inside the SOAP header element `.../osci:MsgBoxResponse`, choice `.../osci:ItemsPending`
1576 MUST be set to the actual value. If `.../osci:ItemsPending` becomes a value auf zero now, this fact
1577 signal the requestor that the `MsgBox` instance may have discarded the search result list referenced by
1578 the identifier `/osci:MsgBoxResponse/@MsBoxRequestID`.

1579 8.2.5 MsgBoxCloseRequest

1580 The functionalities of this message type are:

- 1581 • Recipient commits successful reception of messages from his `MsgBox` instance
- 1582 • Recipient signals the abortion of an iterative pull process of sequences of result requests of
1583 foregoing initial `MsgBoxFetchRequest` respective `MsgBoxStatusListRequest`.

1584 **NOTE:** In case of succesful processing of a `MsgBoxCloseRequest` by the targeted `MsgBox` instance a
1585 response MUST NOT be generated.

1586 The normative outline for the `MsgBoxCloseRequest`:

```
1587 <s12:Envelope ...>
1588   <s12:Header ...>
1589     ...
1590     <wsa:Action>
1591     http://www.osci.eu/ws/2008/05/transport/urn/messageTypes/MsgBoxCloseRequest
1592     </wsa:Action>
1593     <wsa:MessageID>xs:anyURI</wsa:MessageID>
1594     <wsa:To>xs:anyURI</wsa:To>
1595     <osci:TypeOfBusinessScenario wsa:IsReferenceParameter="1">
```

```

1596     xs:anyURI
1597     </osci:TypeOfBusinessScenario>
1598
1599     ...
1600 </s12:Header>
1601 <s12:Body ...>
1602   <osci:MsgBoxCloseRequest MsgBoxRequestID="xs:anyURI">
1603     <osci:LastMsgReceived>wsa:MessageID</LastMsgReceived> *
1604   </osci:MsgBoxCloseRequest>
1605 </s12:Body>
1606 </s12:Envelope>

```

1607 Description of normative constraints on the outline listed above:

1608 **/s12:Envelope/s12:Header/wsa:Action**

1609 The value indicated herein MUST be used for that URI.

1610 **/s12:Envelope/s12:Header/wsa:MessageID**

1611 The request MUST carry a unique WS-Addressing MessageID.

1612 **/s12:Envelope/s12:Header/wsa:To**

1613 The address of the MsgBox (request destination) endpoint.

1614 **/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario**

1615 The corresponding value of the initial MsgBoxFetchRequest or MsgBoxStatusListRequest
1616 MUST be supplied for this message type.

1617 **/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario/**

1618 **@wsa:IsReferenceParameter**

1619 Following WS-Addressing, the element MUST be attributed with

1620 **@wsa:IsReferenceParameter="1"**

1621 The body of this message contains the actual

1622 **/s12:Envelope/s12:Body/osci:MsgBoxCloseRequest.**

1623 **/s12:Envelope/s12:Body/osci:MsgBoxGetNextRequest/@MsgBoxRequestID**

1624 This attribute of type **xs:anyURI** MUST be provided with the value of the with this
1625 message referenced foregoing **MsgBoxResponse/@MsgBoxRequestID**. The MsgBox
1626 service MUST use it to correlate this **MsgBoxCloseRequest** to the initial
1627 **MsgBoxFetchRequest** respective **MsgBoxStatusListRequest**.

1628 **/s12:Envelope/s12:Body/osci:MsgBoxCloseRequest/LastMsgReceived ?**

1629 These optional elements of type **wsa:AttributedURIType** MAY be provided, when the
1630 underlying initial request was of the type **MsgBoxFetchRequest**. The requestor SHOULD
1631 provide here the value(s) of the **/wsa:MessageID** of the last message(s) he received in
1632 the body of the foregoing response(s) to commit successful reception of those messages.
1633 This has to be realized as "reception acknowledge by requester" by the MsgBox instance:
1634 If the SOAP header element **.../osci:MsgTimeStamps/osci:InitialFetch** is absent
1635 or present with a value of zero, the actual server time of the MsgBox instance MUST now
1636 be set here and the value has to be signed according to chapter [8.1]. The resulting
1637 changes in the SOAP header block **/osci:MsgTimeStamps** now MUST be persisted in
1638 the MsgBox store.

1639 It should be noted, that this message type MUST be send to the MsgBox instance ever
1640 when a **MsgBoxFetchRequest** was the initial message send and the requestor pulled a
1641 message successfully the first time (a new message). This triggers the commitment of the
1642 SOAP header **/osci:MsgTimeStamps/osci:Reception** and
1643 **/osci:MsgTimeStamps/osci:InitialFetch** time instances. *It is up to*

1644 *implementations of recipient instances, how distinct between "new" and already*
 1645 *processed messages, because the recipient transport gateway has no implicit control on*
 1646 *the state of the successful body processing (for example to mark message as "readed" or*
 1647 *"processed" – this at least is under the control of the application targeted by the*
 1648 *message).*

1649 To avoid situations, where successful pulled messages on the MsgBox instance side
 1650 remain in the state unpulled, it is strongly recommended to commit every
 1651 MsgBoxResponse to an initial MsgBoxFetchRequest and following series of
 1652 MsgBoxGetNextRequest.

1653 8.2.6 Processing Rules for MsgBoxGetNext/CloseRequest

1654 MsgBox instances are free to to configure a timeout value to retain search result list identified by
 1655 /osci:MsgBoxResponse/@MsgBoxRequestID.

1656 If a MsgBox instance receives a MsgBoxGetNextRequest or a MsgBoxCloseRequest not at all or not
 1657 more known here, no processing on the message database must be done and a following fault MUST
 1658 be generated:

1659 **Fault 8: MsgBoxRequestWrongReference**

1660 [Code] Sender

1661 [Subcode] MsgBoxRequestWrongReference

1662 [Reason] MsgBoxRequestID unknown or timed out.

1663 8.3 Receipts

1664 Requirements for receipting message exchange were outlined in "OSCI-Transport 2.0 – Functional
 1665 Requirements and Design Objectives" and "OSCI-Transport 2 – Technical Features Overview"

1666 Besides provableness of what has been delivered / received when, for messages exchange patterns
 1667 using the MsgBox service it may be of interest for the Initiator to be informed, when the intended
 1668 Recipient pulls the message from his MsgBox. More concrete – the business scenario needs of an
 1669 asynchronous message are bound to reaction times. In this case, a service requestor has to have
 1670 control to in-time delivery to the targeted Recipient. In doubt there isn't any Recipient activity
 1671 concerning the request, a service requestor (or even responder) may choose other communication
 1672 channels to get in contact.

1673 As there may be non-conformant implementations which don't answer to a requested
 1674 ReceptionReceipt, for additional comfort of control whether a message has been pulled yet by the
 1675 intended Recipient, the construct of a **FetchNotification** is foreseen, which alike described for
 1676 receipts can be demanded by Initiator and Recipient instances. If requested, the Recipients MsgBox
 1677 instance MUST deliver such a notification to the endpoint the Initiator specified in his message;
 1678 contents are the SOAP header elements indicating source and destination of the message and the
 1679 time instant when it is pulled by the intended Recipient. No separate signature is foreseen for this
 1680 notification. The FetchNotification is delivered in the SOAP body of a separate osci:Request to the
 1681 endpoint to be exposed in the demand for this FetchNotification – which again in general should be
 1682 the MsgBox of the requesting Initiator or Recipient node.

1683 8.3.1 Demanding Receipts

1684 To demand receipts and define its details, for each specific demand the here defined SOAP header
 1685 blocks MAY be provided in outbound messages of type osci:Request and osci:Response by
 1686 SOAP/OSCI endpoints (Initiator or Recipient).

1687 **8.3.1.1 Demand for Delivery Receipt**

1688 If the next logical OSCI node a message of type `osci:Request` is targeted to shall deliver a
 1689 `DeliveryReceipt` in the backchannel `osci:Response` message, following SOAP header block MUST be
 1690 included in the message:

```
1691 <osci:DeliveryReceiptDemand wsu:Id="xs:ID"
1692   @s12:role=
1693     "http://www.w3.org/2003/05/soap-envelope/role/next" ?
1694   @s12:mustUnderstand= "true" | "false" ?
1695   @qualTSPforReceipt="true" | "false" ?
1696   @echoRequest= "true" | "false" ? >
1697   <wsa:ReplyTo> wsa:EndpointReference </wsa:ReplyTo>
1698 </osci:DeliveryReceiptDemand> ?
```

1699 Description of elements and attributes in the schema overview above:

1700 **/osci:DeliveryReceiptDemand ?**

1701 Optional SOAP header for indicating requirements for a `DeliveryReceipt`. It MUST be
 1702 provided under the conditions mentioned above.

1703 **/osci:DeliveryReceiptDemand/@wsu:Id**

1704 This attribute of type `wsu:Id` SHOULD be provided so that un-ambiguous references can
 1705 be made to this element.

1706 **/osci:DeliveryReceiptDemand/@s12:role**

1707 This attribute of type `xs:anyURI` MAY be provided. It defaults to the URI outlined above.
 1708 If this attribute is provided, it MUST be set to this value. Following the semantics of
 1709 [SOAP12], this SOAP header block is designated to next SOAP-node passed on the
 1710 message route.

1711 **/osci:DeliveryReceiptDemand/@s12:mustUnderstand**

1712 This boolean attribute SHOULD be provided with a value of "true". Following the
 1713 semantics of [SOAP12], this SOAP header block MUST be understood and processed by
 1714 the next SOAP-node passed on the message route willing to act in the role denoted by the
 1715 foregoing attribute `/osci:ReceiptDemand/@s12:role`. For interoperability reasons
 1716 with Web Service implementations not able to process the receipts defined here, it may be
 1717 set to "false" or not present (which is equivalent to a value of "false").

1718 **/osci:DeliveryReceiptDemand/@qualTSPforReceipt ?**

1719 This optional boolean attribute signals – if set to a value of "true" – a qualified timestamp
 1720 for the receipt information is requested. If such a service is not available on the node the
 1721 receipt is demanded from, a fault (see chapter [8.3.2]) MUST be generated to the
 1722 requesting node and the incoming message MUST be discarded.

1723 **/osci:DeliveryReceiptDemand/@echoRequest ?**

1724 This optional boolean attribute signals – if set to a value of "true" – the requesting node
 1725 requires the retransmission of the whole message in the required receipt. In this case, the
 1726 node the receipt is demanded from MUST provide the whole message in binary format in
 1727 the receipt part of the response message (see chapter [8.3.2.1]). Care should be taken to
 1728 use this feature with regard to caused overhead and bandwidth consumption.

1729 If absent, this attribute defaults to a value of "false".

1730 **/osci:DeliveryReceiptDemand/wsa:ReplyTo**

1731 This required element of type `wsa:EndpointReferenceType` denotes the endpoint,
 1732 where the requestor wishes the receipt should be routed to. In case of a `DeliveryReceipt`
 1733 demand in a message of type `osci:Request`, the value herein for `.../wsa:Address`
 1734 SHOULD be `http://www.w3.org/2005/08/addressing/anonymous`; the

1735 DeliveryReceipt is returned directly in the header of the response to the incoming
1736 message in the same http-connection.

1737 In case the requestor wishes a DeliveryReceipt should be routed some specialized
1738 endpoint consuming receipts the EPR of the endpoint MUST be exposed here. The
1739 DeliveryReceipt in this case MUST be delivered in the SOAP body of a separate new
1740 osci:Request message. Hence, this EPR SHOULD be the one of the MsgBox instance of
1741 the requestor. It MAY even be a specialized endpoint consuming receipts. The EPR
1742 MUST contain reference properties according to chapter [6, Addressing Endpoints]. A
1743 .../wsa:ReferenceParameters of following value SHOULD be provided:

```
1744 <osci:TypeOfBusinessScenario>
1745 www.osci.eu/ws/2008/05/common/urn/messageTypes/Receipt
1746 </osci:TypeOfBusinessScenario> .
```

1747 In case of delivering a receipt to a MsgBox instance, this is the defaulted value for
1748 separating receipt message types from other ones (see chapter [6, Addressing
1749 Endpoints]).

1750 An /osci:DeliveryReceiptDemand header block MUST NOT be included in an osci:Response
1751 message. As for an osci:Response, there is no network backchannel available; in this case
1752 DeliveryReceipt could not be delivered in the standard manner. If provability of response delivery is
1753 needed, an /osci:ReceptionReceiptDemand should be used instead.

1754 For synchronous request-response scenarios driven point-to-point between instances of initiator and
1755 recipient, it is advisable to economize demands for receipts to avoid overhead and processing of not
1756 needed DeliveryReceipts. Provability of communication here MAY be gained by a reception receipt
1757 requirement positioned in one or more messages of the request-response sequence, depending on
1758 underlying concrete business process needs. Certainty of delivery itself is implicit given by successful
1759 processing of such a scenario.

1760 **8.3.1.2 Demand for ReceptionReceipt**

1761 If an endpoint a message of type osci:Request or osci:Response is targeted to shall deliver a
1762 ReceptionReceipt, following SOAP header block MUST be included in the message. The underlying
1763 schema is the same as for an osci:DeliveryReceiptDemand SOAP header block; possible
1764 attribute/element values and semantics differ in detail as described below.

```
1765 <osci:ReceptionReceiptDemand wsu:Id="..."
1766   @s12:role=
1767     "http://www.w3.org/2003/05/soap-envelope/role/ultimateReceiver" ?
1768   @s12:mustUnderstand= "true" | "false" ?
1769   @qualTSPforReceipt="true" | "false" ?
1770   @echoRequest= "true" | "false") ? >
1771   <wsa:ReplyTo> wsa:EndpointReference <wsa:ReplyTo>
1772 </osci:ReceptionReceiptDemand> ?
```

1773 Description of elements and attributes in the schema overview above:

1774 /osci:ReceptionReceiptDemand ?

1775 Optional SOAP header for indicating requirements for a ReceptionReceipt.

1776 /osci:ReceptionReceiptDemand/@wsu:Id

1777 This attribute of type wsu:Id SHOULD be provided so that un-ambiguous references can
1778 be made to this element.

1779 /osci:ReceptionReceiptDemand/@s12:role

1780 This attribute of type xs:anyURI MAY be provided. It defaults to the URI outlined above.
1781 If this attribute is provided, it MUST be set to this value; following the semantics of
1782 [SOAP12], this SOAP header block is designated SOAP-node acting in the role of a

1783 ultimate receiver – which is the node at least the SOAP body is designated to,
1784 corresponding to the UltimateRecipient node in the role model of this specification.

1785 `/osci:ReceptionReceiptDemand/@s12:mustUnderstand`

1786 This boolean attribute SHOULD be provided with a value of "true". Following the
1787 semantics of [SOAP12], this SOAP header block MUST be understood and processed by
1788 the next SOAP-node passed on the message route willing to act in the role denoted by the
1789 foregoing attribute `/osci:ReceiptDemand/@s12:role`. For interoperability reasons
1790 with Web Service implementations not able to process the receipts defined here, it may be
1791 set to "false" or not present (which is equivalent to a value of "false").

1792 `/osci:ReceptionReceiptDemand/@qualTSPforReceipt ?`

1793 This optional boolean attribute signals – if set to a value of "true" – a qualified timestamp
1794 for the receipt information is requested. If such a service is not available on the node the
1795 receipt is demanded from, a fault (see chapter [8.3.2]) MUST be generated to the
1796 requesting node and the message MUST be discarded.

1797 `/osci:ReceptionReceiptDemand/@echoRequest ?`

1798 This optional boolean attribute signals – if set to a value of "true" – the requesting node
1799 requires the retransmission of the whole message in the required receipt. In this case, the
1800 node the receipt is demanded from MUST provide the whole message in binary format in
1801 the receipt part of the response message (see chapter [8.3.2.2]). Care should be taken to
1802 use this feature with regard to caused overhead and bandwidth consumption.

1803 If absent, this attribute defaults to a value of "false".

1804 `/osci:ReceptionReceiptTo/wsa:ReplyTo`

1805 This required element of type `wsa:EndpointReferenceType` denotes the endpoint,
1806 where the requestor wishes the receipt should be routed to. A `ReceptionReceipt` in
1807 general MUST be delivered in the SOAP body of a separate new `osci:Request` message,
1808 hence this `EPR` SHOULD be the one of the `MsgBox` instance of the requestor or MAY be
1809 a specialized endpoint consuming receipts. The `EPR` MUST contain reference properties
1810 according to chapter [6, Addressing Endpoints]. A `.../wsa:ReferenceParameters` of
1811 following value SHOULD be provided:

1812 `<osci:TypeOfBusinessScenario>`

1813 `www.osci.eu/ws/2008/05/common/urn/messageTypes/Receipt`

1814 `</osci:TypeOfBusinessScenario>`.

1815 In case off delivering a receipt to a `MsgBox` instance, this is the defaulted value for
1816 separating receipt message types from other ones (see chapter [6, Addressing
1817 Endpoints]).

1818 8.3.2 Receipt Format and Processing

1819 **NOTE:** To facilitate interoperable implementations, it is strongly recommended to use
1820 "<http://www.w3.org/2001/04/xmlenc#sha256>" as digest algorithm for the receipt signatures.

1821 8.3.2.1 Delivery Receipt

1822 DeliveryReceipts MUST be produced immediately after successful acceptance of an incoming
1823 message of type `osci:Request`, if a SOAP header element `/osci:DeliveryReceiptDemand` is
1824 present in the incoming `osci:Request` message.

1825 The data for this type of receipt has to be carried in the resulting SOAP response message in following
1826 SOAP header block `/osci:DeliveryReceipt`:

```
1827 <osci:DeliveryReceipt @wsu:Id="xs:ID"
1828   <osci:ReceiptInfo
1829     @wsu:Id="..."
1830     @osci:ReceiptIssuerRole=
1831       "http://www.osci.eu/ws/2008/05/transport/role/MsgBox" |
1832       "http://www.osci.eu/ws/2008/05/transport/role/Recipient"
1833
1834     <wsa:MessageID>xs:anyURI</wsa:MessageID>
1835     <osci:MsgTimeStamps/>
1836     <wsa:RelatesTo/> *
1837     <osci:To> wsa:EndpointReference </osci:To>
1838     <wsa:ReplyTo> wsa:EndpointReference </wsa:ReplyTo>
1839     <wsa:From> wsa:EndpointReference </wsa:From> ?
1840     <osci:RequestEcho> xs:base64Binary </RequestEcho> ?
1841   </osci:ReceiptInfo>
1842   <ds:Signature/>
1843 </osci:DeliveryReceipt>
```

1844 Description of elements and attributes in the schema overview above:

1845 `/osci:DeliveryReceipt`

1846 Container holding the child elements receipt data `.../osci:ReceiptInfo` and a
1847 `ds:Signature` element over `.../osci:ReceiptInfo`.

1848 `/osci:DeliveryReceipt/@wsu:Id`

1849 This attribute of type `xs:ID` MUST be provided so that un-ambiguous references (i.e. for
1850 transport signature and encryption) can be made to this `/osci:DeliveryReceipt`
1851 block.

1852 `/osci:DeliveryReceipt/osci:ReceiptInfo`

1853 Container to hold the receipt details.

1854 `/osci:DeliveryReceipt/osci:ReceiptInfo/wsu:@Id`

1855 This attribute of type `xs:ID` MUST be provided; the element must be referenceable from
1856 the signature element described below.

1857 `/osci:DeliveryReceipt/osci:ReceiptInfo/osci:ReceiptIssuerRole`

1858 This element of type `xs:anyURI` MUST be provided with one of the URIs outlined above.
1859 The concrete value MUST expose the role of the receipt issuing node. If an `osci:Request`
1860 is targeted to a `MsgBox` instance, the value MUST be
1861 "<http://www.osci.eu/ws/2008/05/transport/role/MsgBox>". If an
1862 `osci:Request` if targeted directly to the recipients OSCI Gateway or an `osci:Response`
1863 message contains a demand for a `DeliveryReceipt`, the value MUST be
1864 "<http://www.osci.eu/ws/2008/05/transport/role/Recipient>".

1865 `/osci:DeliveryReceipt/osci:ReceiptInfo/wsa:MessageID`

1866 The `/wsa:MessageID` SOAP header block of the message to be receipted.

- 1867 **/osci:ReceptionReceipt/osci:ReceiptInfo/osci:MsgTimeStamps**
- 1868 The **/osci:MsgTimeStamps** SOAP header block; this element MUST be inserted after
- 1869 the receiving node has inserted his specific timestamps according to chapter [8.1].
- 1870 **/osci:DeliveryReceipt/osci:ReceiptInfo/wsa:RelatesTo ***
- 1871 The **/wsa:RelatesTo** SOAP header blocks of the message to be received.
- 1872 **/osci:DeliveryReceipt/osci:ReceiptInfo/osci:To**
- 1873 This element of type **wsa:EndpointReference** denotes the destination EPR of the
- 1874 message to be received. At least, it MUST contain the **/wsa:To** SOAP header block of
- 1875 this message and those SOAP header blocks attributed by
- 1876 **@wsa:IsReferenceParameter="1"**.
- 1877 **/osci:DeliveryReceipt/osci:ReceiptInfo/wsa:From ?**
- 1878 If present in the message to be received, the **/wsa:From** SOAP header block of the
- 1879 message to be received.
- 1880 **/osci:DeliveryReceipt/osci:ReceiptInfo/wsa:ReplyTo**
- 1881 The **/wsa:From** SOAP header block of the message to be received.
- 1882 **/osci:DeliveryReceipt/osci:ReceiptInfo/osci:RequestEcho ?**
- 1883 This element MUST be included, if the demand for the receipt contains the attribute
- 1884 **/osci:DeliveryReceiptDemand/@echoRequest** set to a value of **"true"**. The
- 1885 complete incoming message MUST be placed in this element in base64Binary format.
- 1886 To be able to proof what has been sent, the Initiator in this case is strongly advised to
- 1887 encrypt the message body for himself, too.
- 1888 **/osci:DeliveryReceipt/ds:Signature**
- 1889 A digital signature of the DeliveryReceipt according to chapter [7.2].
- 1890 One **ds:Signature** child element **ds:Reference** MUST point to the element
- 1891 **/osci:DeliveryReceipt/ReceiptInfo** using the same-URI reference mechanism
- 1892 via the ID-attribute of this element.
- 1893 A second **/ds:Signature/ds:Reference** element MUST point to the
- 1894 **/s12:Envelope/s12:Body** block of the message to be received using the same-URI
- 1895 reference mechanism via the ID-attribute of the SOAP body block.
- 1896 For a DeliveryReceipt, the received SOAP body block MUST to be signed "as is". The
- 1897 actual server time in UTC-format MUST be provided in
- 1898 **/osci:DeliveryReceipt/ds:Signature/ds:Object/**
- 1899 **xades:QualifyingProperties/xades:SignedProperties/**
- 1900 **xades:SignedSignatureProperties/xades/SigningTime.**
- 1901 If in the receipt demand SOAP header actually processed, the attribute
- 1902 **/osci:DeliveryReceiptDemand/@qualTSPforReceipt** is set to a value of
- 1903 **"true"** and can be served from this instance, the signature element MUST be extended
- 1904 by a *qualified timestamp over the signature itself*. For the timestamp itself, the
- 1905 specification [RFC3161] applies, the placement in the signature element follows [XAdES]
- 1906 as described in chapter [7.2.2]:
- 1907 **../ds:Signature/ds:Object/xades:QualifyingProperties/**
- 1908 **xades:UnsignedProperties/xades:UnsignedSignatureProperties/**
- 1909 **xades:SignatureTimeStamp/xades:EncapsulatedTimeStamp**
- 1910 If no appropriate qualified TSP-service can be provided, a fault MUST be generated to the
- 1911 requestor and processing of the incoming message MUST be aborted.

1912 Fault 9: **QualTSPServiceNotAvailable**
 1913 [Code] Sender
 1914 [Subcode] QualTSPServiceNotAvailable
 1915 [Reason] Requested qualified TSP service not provided by targeted node
 1916 The fault [Details] property MUST outline that this timestamp was requested for a
 1917 DeliveryReceipt and that the message is not accepted.

1918 If an incoming message of type `osci:Request` is to be receipted, the block `/osci:DeliveryReceipt`
 1919 MUST be included as SOAP header in the corresponding `osci:Response` message.

1920 If the message to be receipted is of type `osci:Response`, the block `/osci:DeliveryReceipt` MUST
 1921 be positioned as SOAP body of a new `osci:Request` message. This `osci:Request` message MUST be
 1922 targeted to the endpoint denoted in `/osci:DeliveryReceiptDemand/wsa:ReplyTo`. The SOAP
 1923 header block `/wsa:RelatesTo` of this message MUST be supplied with the `/wsa:MessageID`
 1924 SOAP header block of the message to be receipted.

1925 **NOTE:** If a requested `DeliveryReceipt` can not be produced due to processing errors or other reasons,
 1926 an according SOAP fault MUST be generated according to chapter [5] and the message MUST be
 1927 discarded.

1928 **8.3.2.2 Reception Receipt**

1929 If demanded by a `osci:ReceptionReceiptDemand` SOAP header of a `osci:Request` or
 1930 `osci:Response` message, Reception Receipts MUST be processed after successful decryption of the
 1931 SOAP body block. Depending on the concrete arrangement of roles in an OSCI endpoint
 1932 implementation it may be possible that decryption of the SOAP body and processing of a
 1933 `ReceptionReceipt` demand is decoupled from the node that accepts incoming requests respective
 1934 responses (where `DeliveryReceipt` demands have to be processed immediately). Thus, a
 1935 `ReceptionReceipt` is generated by Ultimate Recipient instances. For a message of type
 1936 `osci:Response`, this is the Ultimate Recipient instance on the Initiator side.
 1937 The data for this type of receipt has to be placed into following block `/osci:ReceptionReceipt` by
 1938 the receipt generating node. The underlying schema is nearly the same as for a
 1939 `osci:DeliveryReceipt` SOAP header block; possible attribute/element values and semantics
 1940 differ in detail as described here.

```

1941 <osci:ReceptionReceipt @wsu:Id="xs:ID" ? >
1942   <osci:ReceiptInfo @wsu:Id="..." >
1943     <wsa:MessageID>xs:anyURI</wsa:MessageID>
1944     <osci:MsgTimeStamps/>
1945     <wsa:RelatesTo/> *
1946     <osci:To> wsa:EndpointReference </osci:To>
1947     <wsa:ReplyTo> wsa:EndpointReference </wsa:ReplyTo>
1948     <wsa:From> wsa:EndpointReference </wsa:From> ?
1949     <osci:RequestEcho> xs:base64Binary </RequestEcho> ?
1950   </osci:ReceiptInfo>
1951   <ds:Signature/>
1952 </osci:ReceptionReceipt>
  
```

1954 Description of elements and attributes in the schema overview above:

1955 **`/osci:ReceptionReceipt`**

1956 Container holding the child elements receipt data `.../osci:ReceiptInfo` and a
 1957 **`ds:Signature`** element over `.../osci:ReceiptInfo`.

1958 **`/osci:ReceptionReceipt/@wsu:Id`**

1959 This attribute of type `xs:ID` SHOULD be provided so that un-ambiguous can be made to
 1960 this `/osci:ReceptionReceipt` block.

1961 **`/osci:ReceptionReceipt/osci:ReceiptInfo`**

- 1962 Container to hold the receipt details.
- 1963 `/osci:ReceptionReceipt/osci:ReceiptInfo/wsua:Id`
- 1964 This attribute of type `xs:ID` MUST be provided; the element must be referenceable from
1965 the signature element described below.
- 1966 `/osci:ReceptionReceipt/osci:ReceiptInfo/wsa:MessageID`
- 1967 The `/wsa:MessageID` SOAP header block of the message to be receipted.
- 1968 `/osci:ReceptionReceipt/osci:ReceiptInfo/osci:MsgTimeStamps`
- 1969 The `/osci:MsgTimeStamps` SOAP header block; this element MUST be inserted after
1970 the receipting node has inserted his specific timestamps according to chapter [8.1].
- 1971 `/osci:ReceptionReceipt/osci:ReceiptInfo/wsa:RelatesTo *`
- 1972 The `/wsa:RelatesTo` SOAP header blocks of the message to be receipted.
- 1973 `/osci:ReceptionReceipt/osci:ReceiptInfo/osci:To`
- 1974 This element of type `wsa:EndpointReference` denotes the destination EPR of the
1975 message to be receipted. At least, it MUST contain the `/wsa:To` SOAP header block of
1976 this message and those SOAP header blocks attributed by
1977 `@wsa:IsReferenceParameter="1"`.
- 1978 `/osci:ReceptionReceipt/osci:ReceiptInfo/wsa:From ?`
- 1979 If present in the message to be receipted, the `/wsa:From` SOAP header block of the
1980 message to be receipted.
- 1981 `/osci:ReceptionReceipt/osci:ReceiptInfo/wsa:ReplyTo`
- 1982 The `/wsa:ReplyTo` SOAP header block of the message to be receipted.
- 1983 `/osci:ReceptionReceipt/osci:RequestEcho ?`
- 1984 This element MUST be included, if the demand for the receipt contains the attribute
1985 `/osci:ReceptionReceiptDemand/@echoRequest` set to a value of `"true"`. The
1986 complete incoming message MUST be placed in this element in base64Binary format.
- 1987 `/osci:ReceptionReceipt/ds:Signature`
- 1988 A digital signature of the ReceptionReceipt according to chapter [7.2.2]. The signature
1989 MUST be generated by the Ultimate Recipient after successful decryption of the whole
1990 SOAP body block. In case a synchronous `osci:Response` to an `osci:Request` containing a
1991 ReceptionReceipt demand, this is the respective UltimateRecipient node on the Initiator
1992 side. If complete decryption of the received SOAP body is not possible, a fault MUST be
1993 generated and further message processing MUST be aborted.
- 1994 Fault 10: **MsgBodyDecryptionError**
- 1995 [Code] Sender
- 1996 [Subcode] MsgBodyDecryptionError
- 1997 [Reason] Message body decryption failed.
- 1998 The fault [Details] property MAY outline – if known to the decrypting instance - the
1999 `ds:X509IssuerSerial` element of the certificate initially used for encryption.
- 2000 One `ds:Signature` child element `ds:Reference` MUST point to the element
2001 `/osci:ReceptionReceipt/ReceiptInfo` using the same-URI reference mechanism
2002 via the ID-attribute of this element.
- 2003 A second `/ds:Signature/ds:Reference` element MUST point to the element
2004 `/s12:Envelope/s12:Body` element of the message to be receipted using the same-

2005 URI reference mechanism via the ID-attribute of the SOAP body block. As already
 2006 mentioned, the SOAP body block in advance MUST have been successfully decrypted.

2007 The actual server time in UTC-format MUST be provided in the child element
 2008 `/xades:SigningTime` of `/osci:ReceptionReceipt/ds:Signature/ds:Object/`
 2009 `xades:QualifyingProperties/xades:SignedProperties/`
 2010 `xades:SignedSignatureProperties`.

2011 If in the receipt demand SOAP header actually processed, the attribute
 2012 `/osci:ReceptionReceiptDemand/@qualTSPforReceipt` is set to a value of
 2013 "true" and can be served from this instance, the signature element MUST be extended
 2014 by a *qualified timestamp over the signature itself*. For the timestamp itself, the
 2015 specification [RFC3161] applies, the placement in the signature element follows [XAdES]
 2016 as described in chapter [7.2.2]:

2017 `.../ds:Signature/ds:Object/xades:QualifyingProperties/`
 2018 `xades:UnsignedProperties/`
 2019 `xades:UnsignedSignatureProperties/`
 2020 `xades:SignatureTimeStamp/xades:EncapsulatedTimeStamp`

2021 If no appropriate qualified TSP-service can be provided, a fault MUST be generated to the
 2022 requestor instead of the ReceptionReceipt, processing of the incoming message MAY
 2023 proceed (subject to policy to be defined for the concrete endpoint). See fault
 2024 **QualTSPServiceNotAvailable** as defined in chapter [8.3.2.1]; the fault [Details] property
 2025 MUST outline that this timestamp was requested for a ReceptionReceipt and if further
 2026 message processing takes place or not.

2027 The block `/osci:ReceptionReceipt` MUST be positioned as SOAP body of a new `osci:Request`
 2028 message. This `osci:Request` message MUST be targeted to the endpoint denoted in
 2029 `/osci:ReceptionReceiptDemand/wsa:ReplyTo`. The SOAP header block `/wsa:RelatesTo` of
 2030 this message MUST be supplied with the `/wsa:MessageID` SOAP header block of the message to
 2031 be received.

2032 8.3.3 Fetched Notification

2033 To demand a FetchedNotification from a recipient MsgBox instance where the message is relayed,
 2034 following SOAP header block MUST be provided in an `osci:Request` message:

```
2035 <osci:FetchedNotificationDemand wsu:Id="..." ?  

  2036   @s12:role="http://www.osci.eu/ws/2008/05/transport/role/MsgBox" ? >  

  2037   <wsa:ReplyTo>wsa:EndpointReference</wsa:ReplyTo>  

  2038 </osci:FetchedNotificationDemand>
```

2039 Description of elements and attributes in the schema overview above:

2040 `/osci:FetchedNotificationDemand`

2041 Header block contain the demand.

2042 `/osci:FetchedNotificationDemand/@wsu:Id`

2043 For ease of referencing this SOAP header block from WS Security SOAP header
 2044 elements, this attribute of type `wsu:Id` SHOULD be provided.

2045 `/osci:FetchedNotificationDemand/@s12:role`

2046 This attribute of type `xs:anyURI` SHOULD²⁰ be provided with the URI outlined above.
 2047 Only nodes acting in the role `MsgBox` are addressed by this type of demand.

²⁰ Proper, this should be a "MUST" – but has been leveraged to SHOULD for interoperability reasons. The current Microsoft WCF-Implementation does not accept other URIs for `s12:role` as predefined in the SOAP 1.2

2048 **/osci:ReceiptTo/wsa:ReplyTo**

2049 This required element of type **wsa:EndpointReferenceType** denotes the endpoint,
 2050 where the requestor wishes the notification should be routed to. As FetchedNotifications
 2051 can only be delivered in the SOAP body of a separate new message, this EPR SHOULD
 2052 be the one of the MsgBox instance of the requestor or MAY be a specialized endpoint
 2053 consuming notifications. The EPR MUST contain reference properties according to
 2054 chapter [6, Addressing Endpoints]. A **.../wsa:ReferenceParameters** of following value
 2055 SHOULD be provided:
 2056 **<osci:TypeOfBusinessScenario>www.osci.eu/ws/2008/05/common/urn/mes**
 2057 **sageTypes/Notification/>**. In case of delivering a receipt to a MsgBox instance,
 2058 this is the defaulted value for separating notification message types from other ones (see
 2059 chapter [6, Addressing Endpoints]).

2060 A SOAP header **/osci:FetchedNotificationDemand** MUST be processed by a node acting in
 2061 the role of MsgBox when the message is pulled the first time by the Recipient of the message. It
 2062 MUST be delivered in a separate message to the endpoint denoted in the appropriate demand. They
 2063 MUST only be produced by MsgBox instances. The **/osci:FetchedNotification** block is
 2064 positioned in the body of such a message, other body parts MUST NOT be included.

2065 Syntax for messages to deliver FetchedNotifications:

```

2066 <s12:Envelope ...>
2067   <s12:Header ...>
2068     ...
2069     <wsa:Action>
2070       http://www.osci.eu/2008/05/transport/urn/messageTypes/OSCIRequest
2071     </wsa:Action>
2072     <wsa:MessageID>xs:anyURI</wsa:MessageID>
2073     <wsa:RelatesTo>xs:anyURI</wsa:RelatesTo>
2074     <wsa:To>xs:anyURI</wsa:To>
2075     <osci:TypeOfBusinessScenario wsa:IsReferenceParameter="1">
2076       "http://www.osci.eu/ws/2008/05/common/urn/messageTypes/Notification"
2077     </osci:TypeOfBusinessScenario>
2078     ...
2079   </s12:Header>
2080   <s12:Body>
2081     <osci:FetchedNotification wsu:Id="..." ?>
2082       <osci:FetchedTime> xs:dateTime </osci:FetchedTime>
2083       <wsa:MessageID>xs:anyURI</wsa:MessageID>
2084       <wsa:To> wsa:Address </wsa:To>
2085       <wsa:From> wsa:EndpointReference </wsa:From>
2086     </osci:FetchedNotification>
2087   </s12:Body>
2088 </s12:Envelope>
  
```

2089 Description of elements and attributes in the schema overview above:

2090 **/s12:Envelope/s12:Header/wsa:Action**

2091 The value indicated herein MUST be used for that URI.

2092 **/s12:Envelope/s12:Header/wsa:MessageID**

2093 The message MUST carry a unique WS-Addressing MessageID.

2094 **/s12:Envelope/s12:Header/wsa:RelatesTo**

2095 The message MUST carry the WS-Addressing MessageID for the message a
 2096 FetchedNotification was requested for.

2097 **/s12:Envelope/s12:Header/wsa:To**

specification. This hopefully will be changed in future releases of WCF, as [SOAP12] explicitly outlines: "... other role names MAY be used as necessary to meet the needs of SOAP applications."

2098 The address of the destination endpoint which was stated in the EPR of the request
 2099 header element `/osci:FetchNotificationTo/wsa:ReplyTo/wsa:Address` of
 2100 the request message.

2101 `/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario`

2102 This is the instantiation of `/wsa:ReferenceParameters` bound to this EPR. It MUST be
 2103 taken from the request header element
 2104 `/osci:FetchNotificationTo/wsa:ReplyTo/wsa:ReferenceParameters` of
 2105 the request message.

2106 `/s12:Envelope/s12:Header/osci:TypeOfBusinessScenario/`
 2107 `@wsa:IsReferenceParameter`

2108 Following WS-Addressing, the element MUST be attributed with
 2109 `@wsa:IsReferenceParameter="1"`

2110 `/s12:Envelope/s12:Body/osci:FetchNotification`

2111 Container holding the FetchNotification.

2112 `/s12:Envelope/s12:Body/osci:FetchNotification/osci:FetchTime`

2113 This element of type `xs:dateTime` MUST be set to the actual server time instance in
 2114 UTC format when the MsgBox node processes the FetchNotification demand (message
 2115 first time pulled from recipient).

2116 8.3.4 Additional Receipt/Notification Demand fault processing Rules

2117 As fault occurrence is imaginable while processing receipt demands, it must be foreseen to
 2118 communicate those faults to the requestor of a receipt. As far as a receipt has to be delivered directly
 2119 in the SOAP header of a response to a request in the same http-connection, such a fault occurrence is
 2120 directly communicated to the requestor by the general SOAP/OSCI fault processing mechanisms and
 2121 the message is discarded. **No receipt SOAP header block MUST be build up and inserted in the**
 2122 **response in this case.**

2123 For receipts which have to be processed asynchronous mode and/or delivered in a separate
 2124 `osci:Request` message, the receipt requestor has to be informed about possible fault occurrence
 2125 asynchronously. This MUST be done by placing the fault information in the body of an `osci:Request`
 2126 instead of the receipt block and delivered to the same endpoint the receipt message is expected.

2127 If the message to be receipted carries a `wsa:FaultTo` SOAP header block, this is the EPR the
 2128 `osci:Request` message carrying the fault MUST be targeted to. If this header is absent or – if present
 2129 and carrying a value of `http://www.w3.org/2005/08/addressing/anonymous` in
 2130 `wsa:FaultTo/Address`, it MUST be targeted to the endpoint denoted in
 2131 `/osci:ReceptionReceiptDemand/wsa:ReplyTo/Address`. The according
 2132 `wsa:ReferenceParameters` SOAP header block MUST be

```
2133 <osci:TypeOfBusinessScenario wsa:IsReferenceParameter="true">
2134   www.osci.eu/ws/2008/05/common/urn/messageTypes/Fault
2135 </osci:TypeOfBusinessScenario>
```

2136 The SOAP header block `/wsa:RelatesTo` of this message MUST be supplied with the
 2137 `/wsa:MessageID` SOAP header block of the message to be receipted.

2138 ReceptionReceipts and FetchNotification in general have to be delivered in asynchronous mode. If
 2139 the request for these doesn't indicate a valid address they can be successfully targeted to, standard
 2140 SOAP addressing error handling applies according to [WSASOAP]; see chapter [5.2] for additional
 2141 information.

2142 **NOTE:** Message processing MUST NOT be aborted in this situations.²¹

2143 **8.3.4.1 Receipt Signature Validation**

2144 Receipt signatures MUST be verified by receipt consuming nodes. If signature verification fails, a fault
2145 MUST be generated and be made available to the Source Application instance initially triggering the
2146 corresponding receipt demand. Fault delivery in this case is a matter of implementation.

2147 Fault 11: **SignatureOfReceiptInvalid**

2148	[Code] Sender
2149	[Subcode] SignatureOfReceiptInvalid
2150	[Reason] Receipt signature verification failed.

2151 The fault [Details] property SHOULD outline the concrete verification failure. It is on behalf of the
2152 Source Application to handle this situation.

2153 **8.4 X.509-Token Validation on the Message Route**

2154 A custom SOAP header is defined here for carrying X.509-Certificates and details per usage instance
2155 in the referred message body block parts.

2156 Certificate validation processing SOAP nodes MUST enrich the message SOAP header block with the
2157 gathered certificate validation results and – for processing optimization purposes – mark those usage
2158 instances of a certificate as "checked", if validation could be processed successfully.

2159 **NOTE:** This custom SOAP header is optional. It SHOULD be provided in infrastructures able to
2160 perform certificate validation on the message route (which means, having a node available
2161 implementing the syntax and semantics defined her).

2162 An XML-Syntax to carry validation results is defined by XKMS 2/XKISS [XKMS], which is incorporated
2163 here. The `/xkms:ValidateResult` specified in XKMS includes original validation responses from
2164 CAs like OCSP-Responses and CRLs. In addition to [XKMS], extensions are defined to satisfy
2165 requirements coming out the German signature law/directive regarding certificate validation. These
2166 extensions are optional in general, but MUST be provided from OSCI service providers in Germany.

2167 Ultimate Recipients of messages MAY rely on the validation information thus once included in the
2168 message body. As at least the inner CA-Responses are verifiable, as they are carrying signatures of
2169 respective validation responders (OCSP, CRL...). In general, it's up to each node or endpoint on the
2170 message route to rely on the validation information found in the message or to initiate revalidation of
2171 used certificates following own needs und trust relations.

2172 This specification enforces no rules how a node serving certificate validation obtains certificate
2173 validation results. It SHOULD be preferred to use the services of a trusted XKMS/XKISS responder
2174 instance, like this a `/xkms:ValidateResult` can easily be gathered by the corresponding
2175 `/xkms:ValidateRequest`. If the used XKMS/XKISS responder is designed as a relay bridging links
2176 to all relevant CAs concerning the overall requirements of a concrete OSCI based communication
2177 network, the burden of administrating CA-links and serving further protocols for those links is
2178 delegated to the XKMS/XKISS responder provider.

2179 If using a XKMS responder, it is advisable to use the advantage of compound validation request
2180 offered by the XKMS/XKISS protocol. All validation requests for all usage instances of the certificates
2181 exposed in the `/osci:X509TokenContainer` custom SOAP header block MAY be combined in one
2182 compound request, which leads to a corresponding compound response. See [XKMS] for further
2183 details.

²¹ Mechanisms SHOULD be considered how to inform the Initiator about the situation that requested receipts/notifications cannot be delivered. This is out of scope of this specification.

2184 8.4.1 X.509-Token Container

2185 This chapter describes this optional custom header to carry those certificates. In addition to the token
2186 themselves, following information is carried, which has to be provided by Source- / Target Applications
2187 per token-usage:

- 2188 • Where a certificate is used in the body (by IDREF); information may be useful at recipient
2189 side when parsing a message after SOAP body block decryption and grouping together
2190 derived body block parts with their respective certificates/validation results (at least.
2191 validation of signatures contained in the body SHOULD happen now)
- 2192 • Application time instant (this is the time instant a certificate must be proven as valid)
- 2193 • Possibility to indicate forced online OCSP request to downstream validation service nodes
2194 (force bypassing possible cacheing of once gained OCSP responses).

2195 While processing the validation, such a node supplies following additional information:

- 2196 • A reference to the corresponding `/xkms:ValidateResult` per usage instance
- 2197 • An indicator "validated" if all usage instance of a token have successfully been validated
2198 (note: only indication the fact of validation, not the result!)
- 2199 • An indicator "validation completed" when all usage instances of all carried token have
2200 successfully been validated.

2201 As under certain circumstances it may be, that a certificate validations serving node is not able to
2202 gather all needed `/xkms:ValidateResult(s)` completely, the latter two indicators only serve for
2203 processing optimization – they can be used to avoid iterating through the X509 token container and
2204 checking for outstanding `/xkms:ValidateResult(s)` by downstream nodes / endpoints on the
2205 message route.

2206 Syntax for an optional `/osci:X509TokenContainer`:

```
2207 <osci:X509TokenContainer validateCompleted=("true" | "false")? >
2208   <osci:X509TokenInfo Id="xs:ID"
2209     validated=("true" | "false")? >
2210     <ds:X509Data>
2211       <ds:X509Certificate>
2212     </ds:X509Data>
2213     <osci:TokenApplication
2214       oospNoCache=("true" | "false")? >
2215       validateResultRef="xs:IDREF" ? >
2216       <osci:TimeInstant>xs:dateTime</osci:TimeInstant>
2217       <osci:MsgItemRef>xs:IDREF</osci:MsgItemRef>
2218     </osci:TokenApplication> +
2219   </osci:X509TokenInfo> +
2220 </osci:X509TokenContainer>
```

2221 Description of elements and attributes in the schema overview above:

2222 `/osci:X509TokenContainer ?`

2223 Optional SOAP header block containing the X.509-Certificates which SHOULD be
2224 validated by a node on the message route with validation capabilities.

2225 This container SHOULD be provided by a Source Application together with the payload to
2226 be placed in the message body block at OSCI gateway entry point towards applications.
2227 If present in an incoming message, it MUST be provided to the addressed Target
2228 Application by the recipients OSCI gateway.

2229 `/osci:X509TokenContainer/@validateCompleted ?`

2230 This optional boolean attribute MUST be provided with a value of "true" by a validation
2231 processing node, when processing was successfully passed for all application instances
2232 of all contained items `/osci:X509TokenInfo`. It MUST NOT provided with a value of

- 2233 "true" if this condition is false – i.e. only partially successful validation processing. It MUST
2234 NOT be provided or changed by other logical instances than validation processing nodes.
- 2235 **/osci:X509TokenContainer/osci:X509TokenInfo +**
- 2236 If an **/osci:X509TokenContainer** is present, it MUST contain at least one item of this
2237 type; content description follows here:
- 2238 **/osci:X509TokenContainer/osci:X509TokenInfo/@Id**
- 2239 This mandatory attribute of type **xs:ID** MUST be provided. As the whole
2240 **/osci:X509TokenContainer** is initially to be generated by a Source Application
2241 instance, the value must be a UUID; the UUID-value MUST NOT start with a character
2242 unlike the **xs:ID** production rules and SHOULD therefore be preceded by a string of
2243 "uuid:". This attribute MUST NOT be provided or changed by other logical instances than
2244 Source Applications.
- 2245 **/osci:X509TokenContainer/osci:X509TokenInfo/@validated ?**
- 2246 This optional boolean attribute of type **xs:ID** MUST be provided with a value of "true" by
2247 a validation processing node, when processing was successfully passed for all application
2248 instances of this item **/osci:X509TokenInfo**. It MUST NOT provided with a value of
2249 "true" if this condition is false – i.e. only partially successful validation processing. It MUST
2250 NOT be provided or changed by other logical instances than validation processing nodes.
- 2251 **/osci:X509TokenContainer/osci:X509TokenInfo/ds:X509Data**
- 2252 The X.509-Token of type **ds:Data** MUST be provided here by the Source Application
2253 instance. Other sub-elements than **x509Certificate** foreseen in **ds:X509Data** MUST
2254 NOT be provided.
- 2255 **/osci:X509TokenContainer/osci:X509TokenInfo/ds:X509Data/ds:X509Certificate**
- 2256 Sub-element **.../ds:509Certificate** MUST be provided. It MUST NOT be provided or
2257 changed by other logical instances than Source Applications.
- 2258 **/osci:X509TokenContainer/osci:X509TokenInfo/osci:TokenApplication**
- 2259 A Source Application MUST initially provide this container containing application details of
2260 the X.509-Token.
- 2261 **/osci:X509TokenContainer/osci:X509TokenInfo/osci:TokenApplication/
2262 @ocspNoCache ?**
- 2263 This optional boolean attribute MUST be provided with a value of "true" by the Source
2264 Application instance, when the downstream validation service node shall be forced
2265 bypassing possible cacheing of OCSP responses while validating this certificate. If not
2266 provided with a value of "true", a validation service node MAY use cacheing mechanisms
2267 to build up validation results. It MUST NOT be provided or changed by other logical
2268 instances than a Source Application instance.
- 2269 **/osci:X509TokenContainer/osci:X509TokenInfo/osci:TokenApplication/
2270 @validateResultRef ?**
- 2271 Validation processing nodes MUST provide an **xs:IDREF** here when processing was
2272 successfully passed for this instance of **/osci:X509TokenInfo/TokenApplication**.
2273 It must point to the related **/xkms:ValidateResult** header child element (see next
2274 chapter). It MUST NOT be provided or changed by other logical instances than validation
2275 processing nodes. If present, this attribute indicates, that this instance of
2276 **/osci:X509TokenInfo/osci:TokenApplication** is validated.
- 2277 **/osci:X509TokenContainer/osci:X509TokenInfo/osci:TokenApplication/
2278 osci:TimeInstant**

2279 This element of type `xs:dateTime` MUST be provided by the Source Application
 2280 instance and carry the token application time instant. This time instant MUST be taken as
 2281 validation time instant by the validation processing node (see next chapter). It MUST NOT
 2282 be provided or changed by other logical instances than Source Applications.

2283 `/osci:X509TokenContainer/osci:X509TokenInfo/osci:TokenApplication/`
 2284 `osci:MsgItemRef`

2285 This element of type `xs:IDREF` MUST be provided by the Source Application instance
 2286 and carry a reference to the cryptographic element in the message body where the token
 2287 was used. It MUST NOT be provided or changed by other logical instances than Source
 2288 Applications.

2289 8.4.2 X.509-Token Validation Results

2290 SOAP nodes which are willing and able processing validation for X.509-Certificates contained in the
 2291 `/osci:X509TokenContainer` SOAP header block MUST insert the processing result in SOAP
 2292 header blocks `/xkms:CompoundResult` containing one or more `/xkms:ValidateResult`
 2293 elements conformant to the part XKISS of the XKMS specification. See [XKMS] for details, whereby
 2294 following profiling applies here:

2295 **R1100:** Validation results MUST be signed by the generating instance. This MAY be a XKMS-
 2296 Responders involved or – if no dedicated XKMS-Responder is used – the node generating
 2297 the header block `/xkms:CompoundResult` containing the `/xkms:ValidateResult`
 2298 elements. Hence, the element `/xkms:CompoundResult/ds:Signature` MUST be
 2299 present. The subordinate signature elements `/xkms:ValidateResult/ds:Signature`
 2300 SHOULD be omitted.

2301 **R1120:** For nodes consuming the validation results, it MUST be able to establish trust to the
 2302 validation results generating node through the certificate used for this signature. If no trust
 2303 can be established, these nodes MUST ignore the affected header block
 2304 `/xkms:CompoundResult` and MUST revalidate the affected certificates using a service
 2305 trusted by this node.

2306 **R1130:** Nodes consuming the validation results MUST validate the signature of the
 2307 `/xkms:CompoundResult`. If signature validation fails, this fact MUST be logged as a
 2308 security error including the affected header block. This header block MUST be ignored,
 2309 the affected certificates using a service trusted by this node.

2310 For XKMS messages an abstract extension point `xkms:MessageExtension` is foreseen to carry
 2311 additional information. German regulations as well as EU-wide efforts for alignment of interoperable
 2312 use of electronic signatures require detailed information on certificate quality, validity status, used
 2313 algorithm suitability and the validation process itself. Thus, a `/xkms:ValidateResult` SHOULD
 2314 contain an extension block `/xkmsEU`, XML namespace
 2315 `http://www.lsp.eu/2009/04/xkmsExt#` as defined in chapter 5.3 of [XKMSEU]²².

2316 8.4.3 Verification of XKMS Validate Result Signatures

2317 Signatures of `xkms:CompoundResult` header elements MUST be verified by nodes consuming
 2318 these header elements during the process of Content Data signatures. If signature verification fails, a
 2319 fault MUST be generated and be made available to the instance validating Content Data signatures.
 2320 Affected `xkms:CompoundResult` header element MUST NOT be consumed, certificate validation

²² These extensions are subject to alignment in the context of running EU-wide "Large Scale Pilot" (lsp) projects. Concrete work on these issues is done by the project PEPPOL, see www.peppol.eu. One goal is a common XKMS-Responder infrastructure in the EU member states. The namespace has to be seen as preliminary. The concrete XKMS extension structure is subject to further refinement in 2009.

2321 processing MUST be reprocessed by means out of scope of this specification. It is strongly
2322 RECOMMENDED to log this security error. Fault delivery is an implementation matter.

2323 Fault 12: **SignatureOfValidateResultInvalid**

2324 [Code] Sender

2325 [Subcode] SignatureOfValidateResultInvalid

2326 [Reason] Verification failed for XKMS validate result

2327 The fault [Details] property SHOULD outline the concrete verification failure.

2328 8.5 General Processing of Custom Header Faults

2329 Nodes a message is targeted to MUST validate the structure of the OSCI extension headers. If
2330 syntactically invalid or not conformant to this specification, the message MUST be discarded and
2331 following fault MUST be generated:

2332 Fault 13: **MsgHeaderStructureSchemaViolation**

2333 [Code] Sender

2334 [Subcode] MsgHeaderStructureSchemaViolation

2335 [Reason] One or more OSCI header violate schema definitions

2336 More information SHOULD be given in the fault [Details] property, at least the concrete header
2337 element the error was located in form of an XPath expression relative to the `s12:Envelope` element.

2338 **9 Constituents of OSCI Message Types**

2339 For all OSCI message types, the SOAP header and body block assemblies as well as their respective
2340 transport signature/transport encryption requirements are defined in this chapter.

2341 For a quick overview, constituents of each message type are illustrated in diagrams.

2342 In general, most header and body blocks are marked to be encrypted optionally. These blocks **MUST**
2343 be included in the transport encryption according to chapter [7], if no symmetric binding (transport over
2344 https) is used or the network between nodes involved in the message transport is secured by other
2345 precautions.

2346 **9.1 osci:Request**

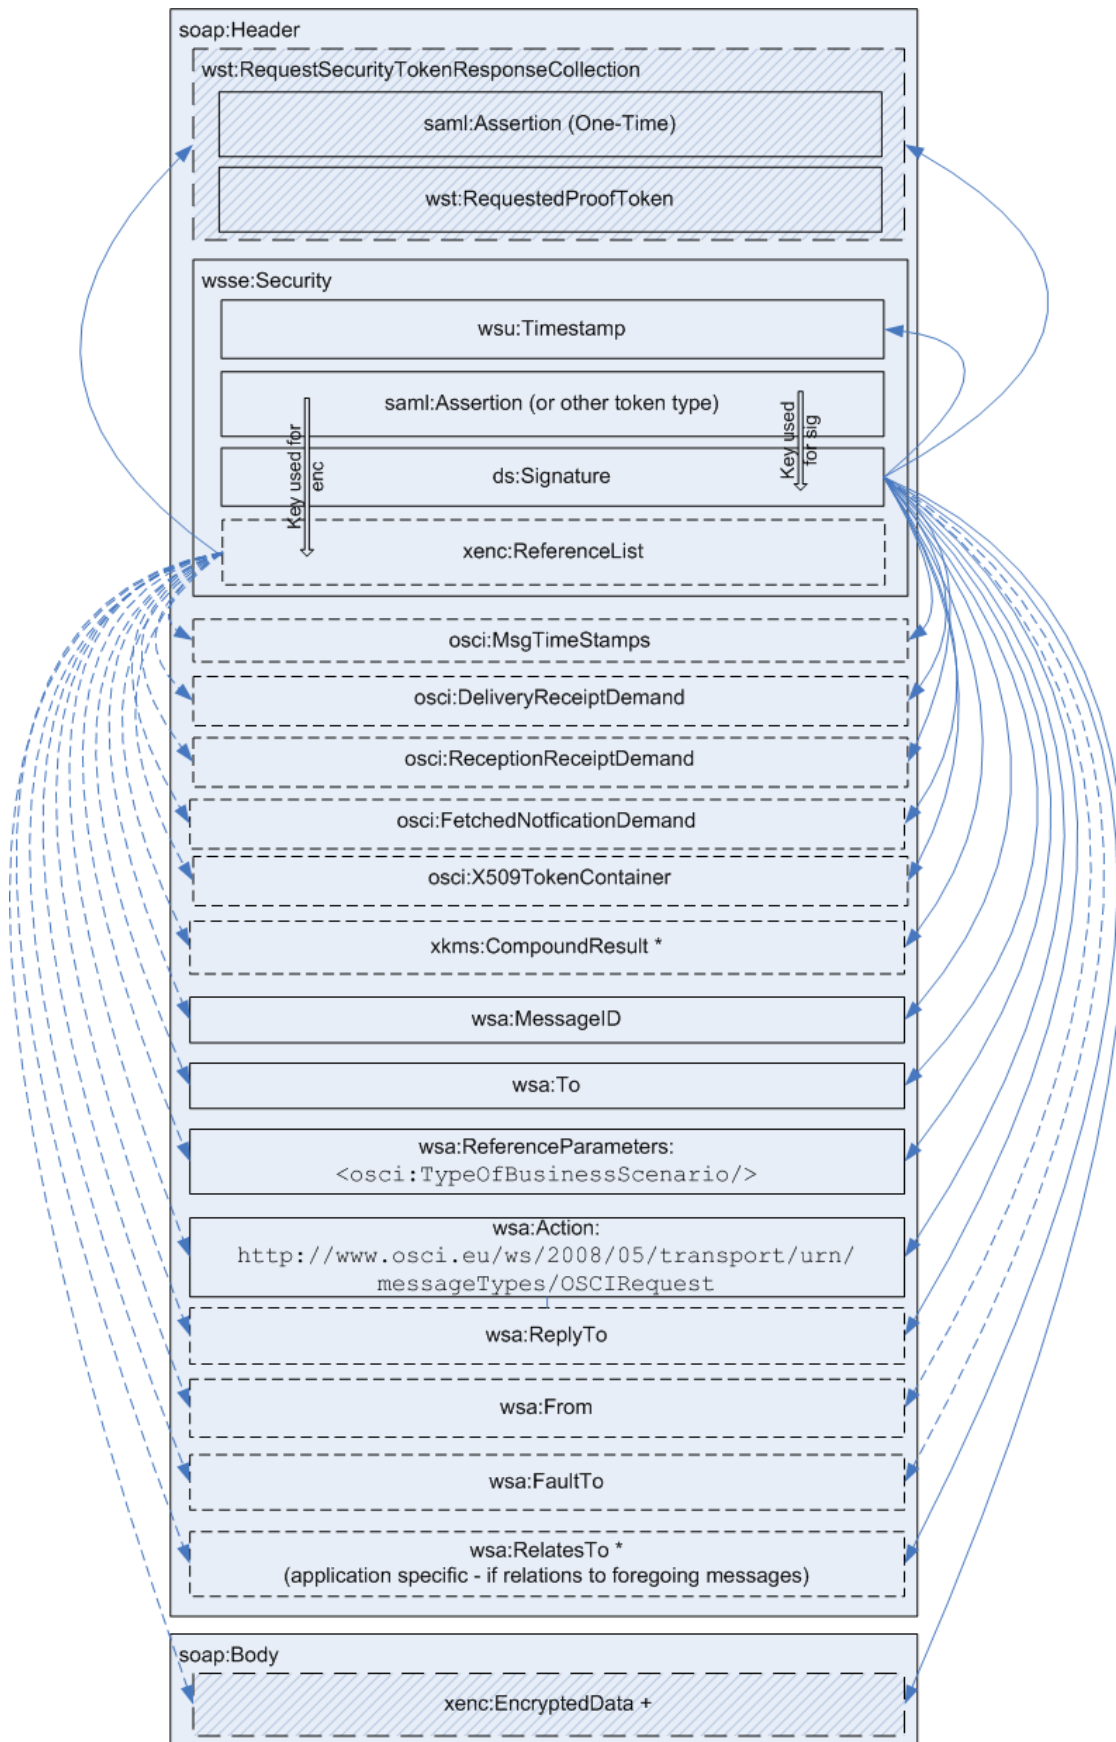

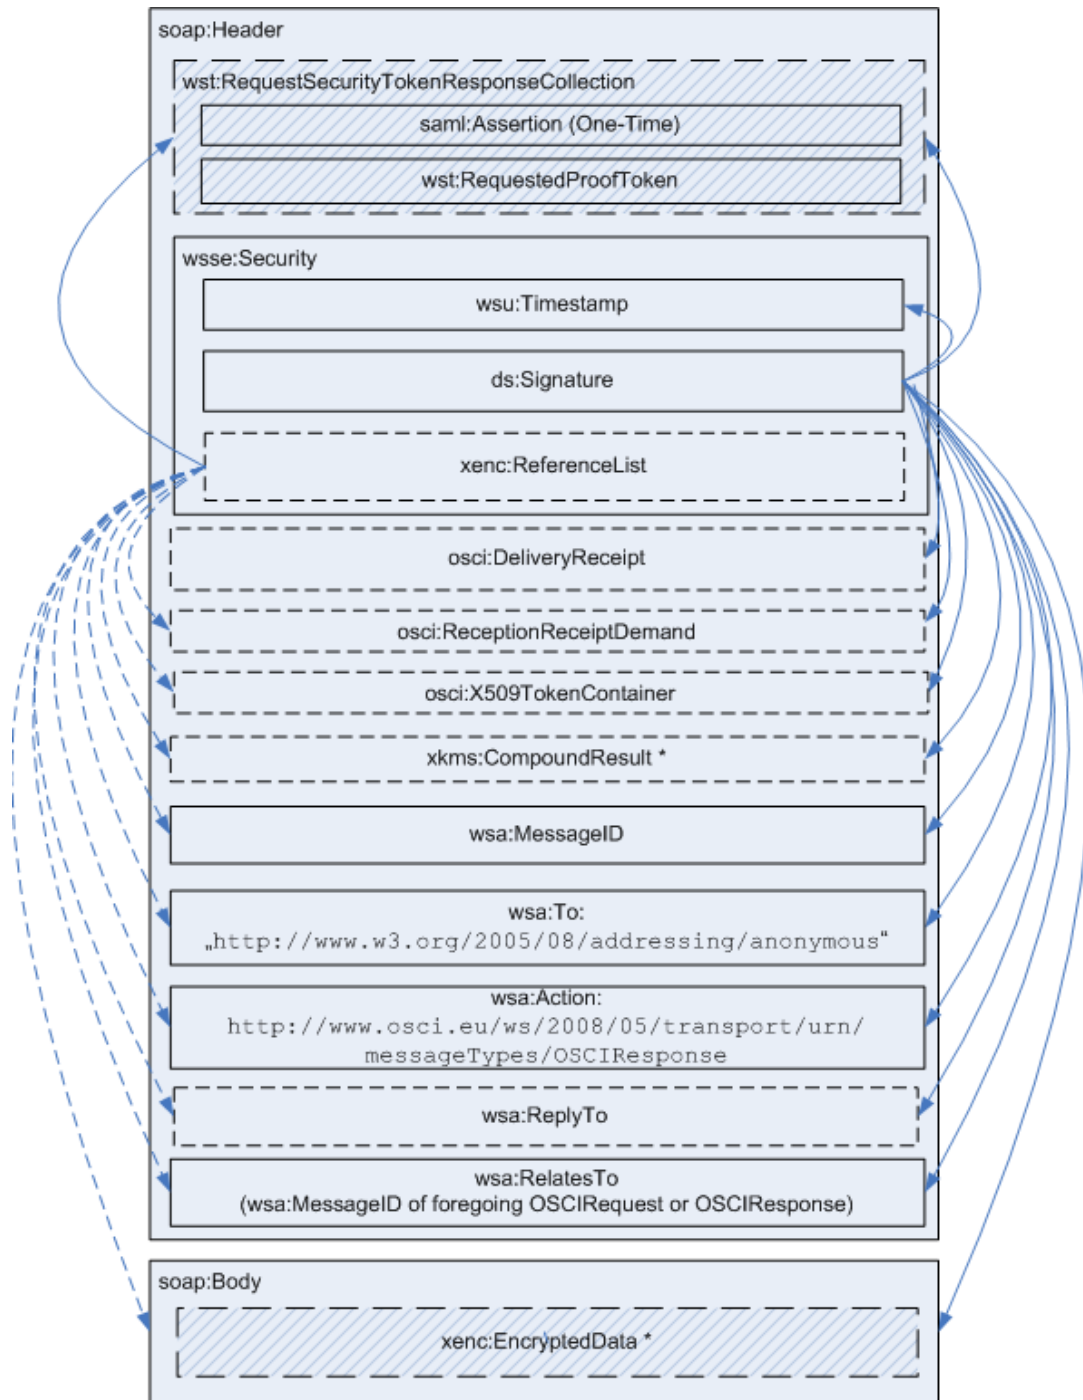

Figure 8: osci:Request header and body block assembly

2347

2348

- 2349 SOAP header blocks:
- 2350 **/wst:RequestSecurityTokenResponseCollection ?**
- 2351 This header block carries the SAML token which is needed for asynchronously delivery of
2352 receipts and notification (see chapter [7.5.5] for details). It MUST only be present, when
2353 these receipts and/or notification are required from a node in a foreign TD.
- 2354 **/wsse:Security**
- 2355 This header block MUST be present, carrying message protection data and Initiator
2356 authentication and authorization information items according the security policy of the
2357 node the message is targeted to. See chapter [7.1] for details.
- 2358 **/osci:MsgTimeStamps ?**
- 2359 This optional header block MUST only be set by the Initiator, if he wishes to supply a
2360 **.../osci:ObsoleteAfter** date in here. This header block MUST be set by a MsgBox
2361 instance and MAY be set – if not yet present - by a Recipient instance. This header block
2362 MUST always be relayed. See chapter [8.1] for details.
- 2363 **/osci:DeliveryReceiptDemand ?**
- 2364 This optional header block MUST only be set by the Initiator, if he wishes to receive a
2365 DeliveryReceipt in the backchannel response message. This header block MUST be
2366 removed from the message by the node processing it. See chapter [8.3.1.1] for details.
- 2367 **/osci:ReceptionReceiptDemand ?**
- 2368 This optional header block MUST only be set by the Initiator, if he wishes to receive a
2369 ReceptionReceipt. This header block MUST be removed from the message by the node
2370 processing it. See chapter [8.3.1.2] for details.
- 2371 **/osci:FetchedNotificationDemand ?**
- 2372 This optional header block MUST only be set by the Initiator, if he wishes to receive a
2373 FetchedNotification. This header block MUST only be processed by a MsgBox node
2374 instance and MUST be removed from the message after processing it. See chapter [8.3.3]
2375 for details.
- 2376 **/osci:X509TokenContainer ?**
- 2377 This optional header block SHOULD by provided by the Initiator, if he wishes to enable
2378 certificate validation on the message route. This header block MUST always be relayed.
2379 See chapter [8.4.1] for details.
- 2380 **/xkms:CompoundResult ***
- 2381 These optional header blocks MUST by provided by nodes processing the header block
2382 **/osci:X509TokenContainer**. These header blocks - containing
2383 **/xkms:ValidateResult** elements - MUST always be relayed. See chapter [8.4.2] for
2384 details.
- 2385 **/wsa:***
- 2386 All WS-Addressing headers MUST (if in continuous blocks) /MAY (if in dashed blocks) be
2387 supplied by the Initiator and MUST always be relayed. See chapter [6.1.2] for details.
- 2388 SOAP body:
- 2389 Carries the request message ContentData, generally MUST be encrypted by the Source
2390 Application or Initiator for the Ultimate Recipient.
- 2391

2392 **9.2 osci:Response**

2393

2394

Figure 9: osci:Response header and body block assembly

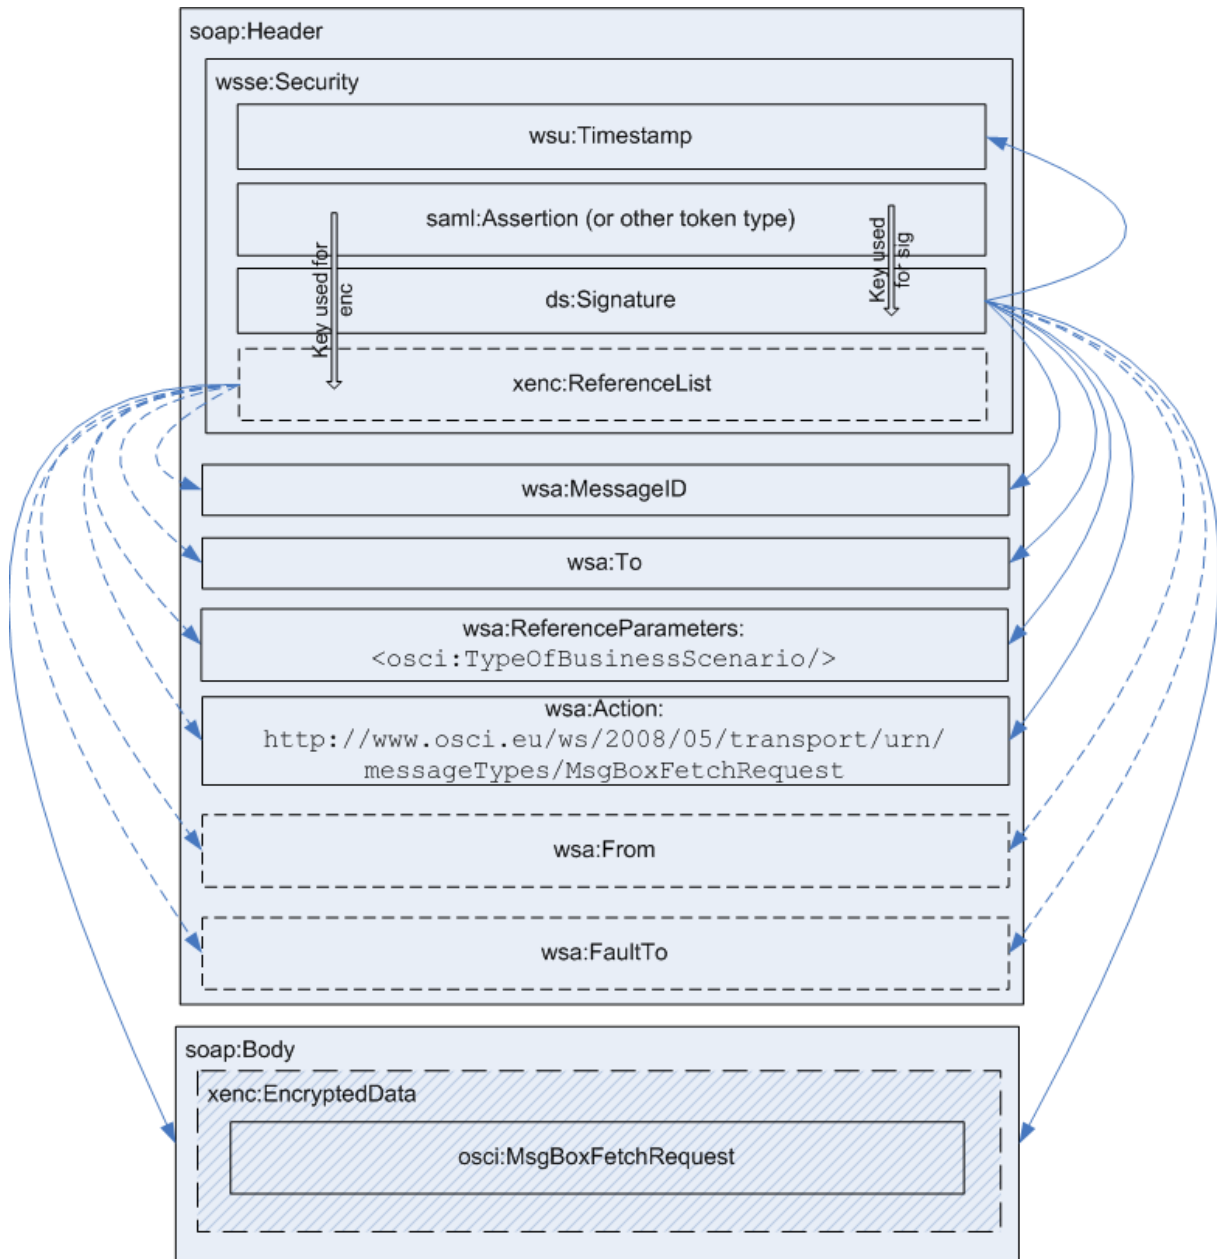

2395 SOAP header blocks:

2396 **/wst:RequestSecurityTokenResponseCollection ?**

2397 This header block carries the SAML token which is needed for asynchronously delivery of
 2398 receipts and notification (see chapter [7.5.5] for details). It **MUST** only be present, when
 2399 these receipts and/or notification are required from a node in a foreign TD.

- 2400 **/wsse:Security**
- 2401 This header block **MUST** be present, carrying message protection data. See chapter [7.1]
2402 for details.
- 2403 **/osci:DeliveryReceipt ?**
- 2404 This optional header block **MUST** be provided by the responding endpoint, if a demand for
2405 a DeliveryReceipt is present in the corresponding request. This header block **MUST** not
2406 be discarded or changed on the message route. See chapter [8.3.2] for details.
- 2407 **/osci:ReceptionReceiptDemand ?**
- 2408 This optional header block **MUST** only be set by the responding Recipient, if he wishes to
2409 receive a ReceptionReceipt for the response message. This header block **MUST NOT** be
2410 set by a MsgBox instance. This header block **MUST** be removed from the message by the
2411 node processing it. See chapter [8.3.1.2] for details.
- 2412 **/osci:X509TokenContainer ?**
- 2413 This optional header block **SHOULD** be provided by the responding Recipient, if he
2414 wishes to enable certificate validation on the message route. This header block **SHOULD**
2415 **NOT** be set by a MsgBox instance. This header block **MUST** always be relayed. See
2416 chapter [8.4.1] for details.
- 2417 **/xkms:CompoundResult ***
- 2418 These optional header blocks **MUST** be provided by nodes processing the header block
2419 **/osci:X509TokenContainer**. These header blocks - containing
2420 **/xkms:ValidateResult** elements - **MUST** always be relayed. See chapter [8.4.2] for
2421 details.
- 2422 **/wsa:***
- 2423 All WS-Addressing headers **MUST** (if in continuous blocks) **/MAY** (if in dashed blocks) be
2424 supplied by the resending endpoint and **MUST** always be relayed. See chapter [6.1.2] for
2425 details.
- 2426 SOAP body:
- 2427 May carry the response message ContentData in case of point-to-point scenarios. If
2428 present, it generally **MUST** be encrypted by the Target Application or Recipient for the
2429 Initiator. If an error occurred, a fault message is placed here instead.

2430 **9.3 MsgBoxFetchRequest**

2431
2432 Figure 10: MsgBoxFetchRequest header and body block assembly

2433 SOAP header blocks:

2434 **/wsse:Security**

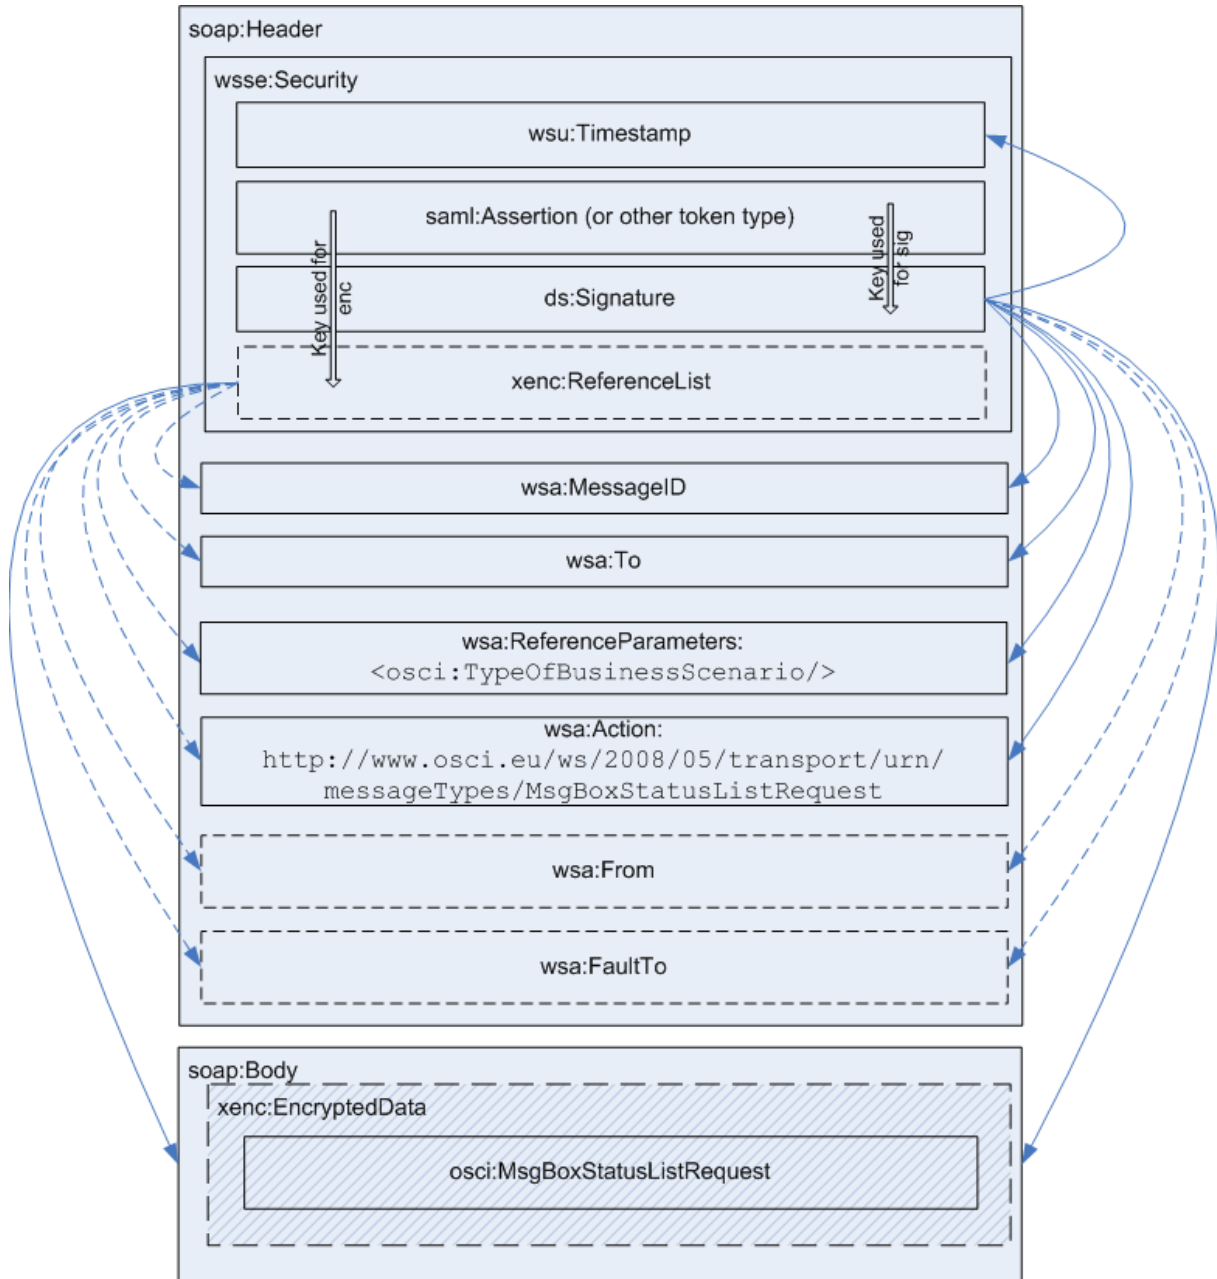

2435 This header block MUST be present, carrying message protection data and requestor
2436 (MsgBox owner in this case) authentication and authorization information items according
2437 the security policy MsgBox instance. See chapter [7.1] for details.

2438 **/wsa:***

2439 All WS-Addressing headers MUST (if in continuous blocks) /MAY (if in dashed blocks) be
2440 supplied by the Initiator. See chapter [6.1.2] and [8.2.1] for details.

- 2441 SOAP body:
- 2442 Carries the details of the MsgBoxFetchRequest, generally MUST be transport encrypted.
- 2443 See chapter [8.2.1] for details.

2444 **9.4 MsgBoxStatusListRequest**

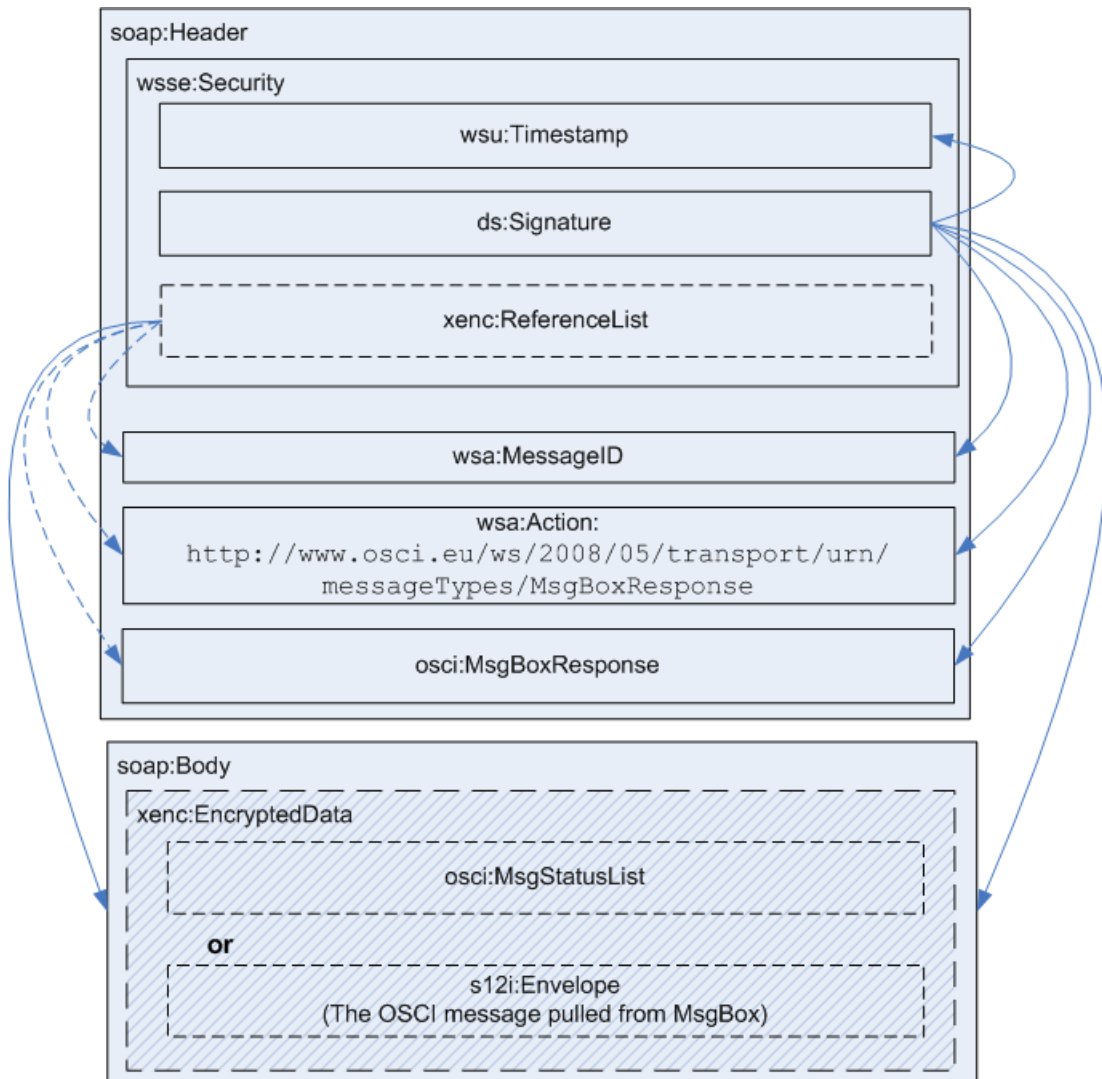

2445
2446 Figure 11: MsgBoxStatusListRequest header and body block assembly

- 2447 SOAP header blocks:
- 2448 **/wsse:Security**
- 2449 This header block MUST be present, carrying message protection data and requestor
- 2450 (MsgBox owner in this case) authentication and authorization information items according
- 2451 the security policy MsgBox instance. See chapter [7.1] for details.

- 2452 / **wsa:***
- 2453 All WS-Addressing headers **MUST** (if in continuous blocks) /**MAY** (if in dashed blocks) be
- 2454 supplied by the Initiator. See chapter [6.1.2] and [8.2.2] for details.
- 2455 SOAP body:
- 2456 Carries the details of the MsgBoxFetchRequest, generally **MUST** be transport encrypted.
- 2457 See chapter [8.2.2] for details.

2458 **9.5 MsgBoxResponse**

2459
2460 Figure 12: MsgBoxResponse header and body block assembly

- 2461 SOAP header blocks:
- 2462 / **wsse:Security**
- 2463 This header block **MUST** be present, carrying message protection data. See chapter [7.1]
- 2464 for details.
- 2465 / **wsa:***
- 2466 All WS-Addressing headers **MUST** (if in continuous blocks) /**MAY** (if in dashed blocks) be
- 2467 supplied by the Initiator. See chapter [6.1.2] and [8.2.3] for details.

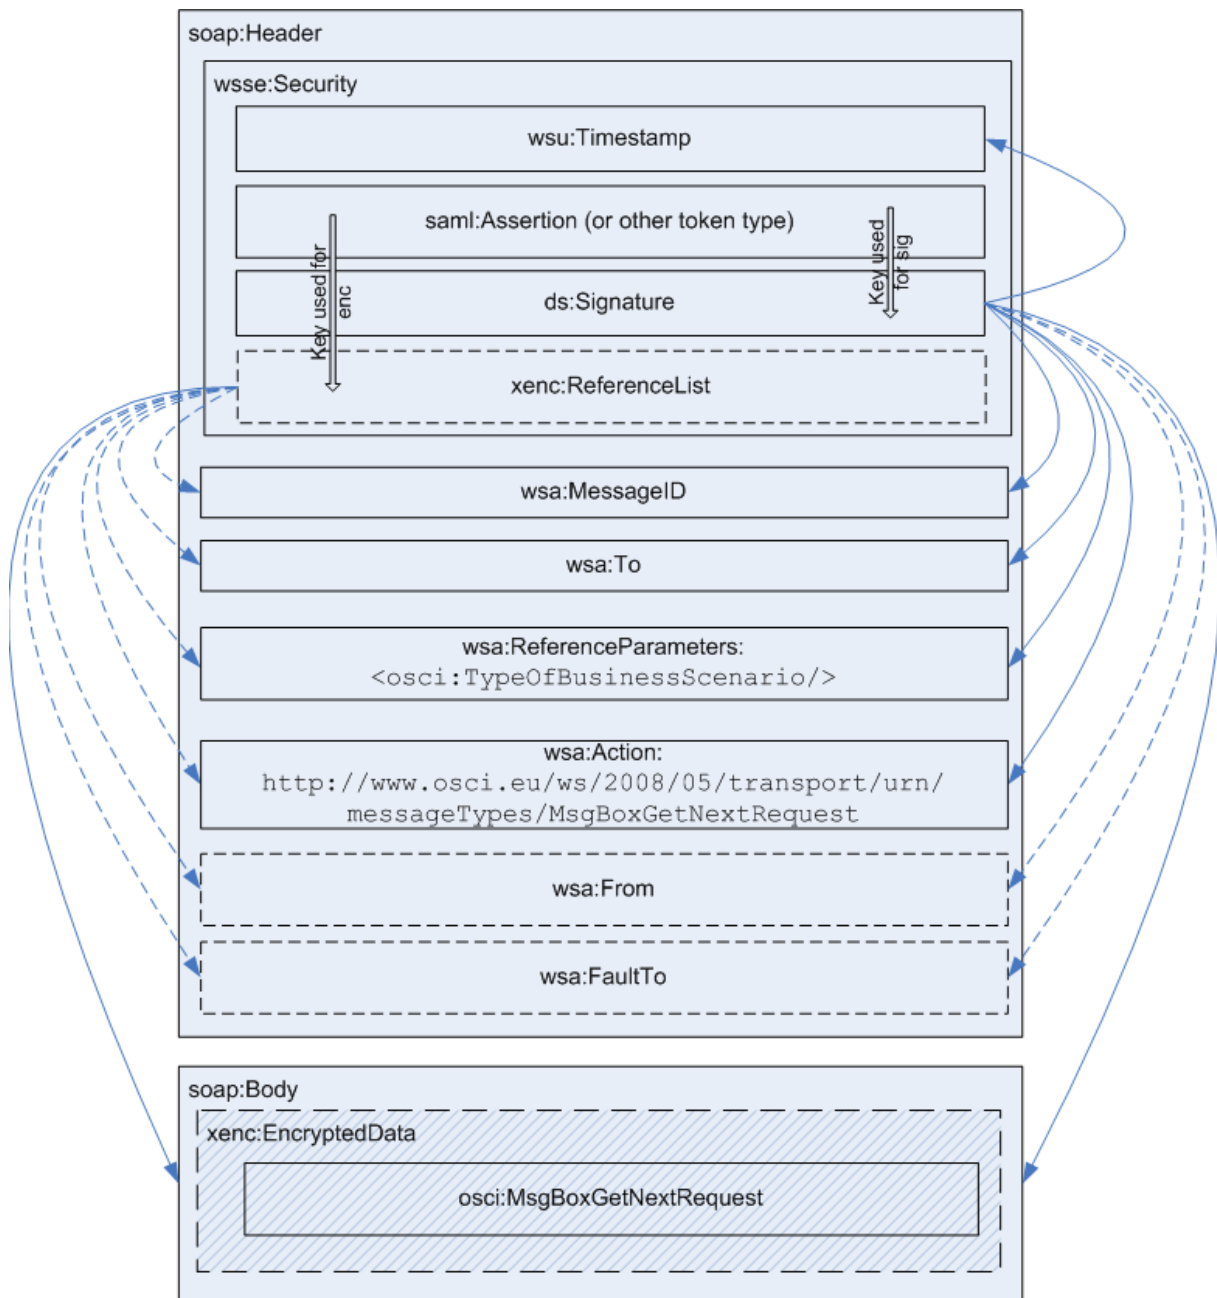

2468 /osci:MsgBoxResponse

2469 This header carrying status information concerning the actual message box access MUST
 2470 be set by the resending MsgBox instance. See chapter [8.2.3] for details.

2471 SOAP body:

2472 Carries the requested message status list or the message fetched from the MsgBox –
 2473 depending on the initial request. It generally MUST be transport encrypted. See chapter
 2474 [8.2.3.1] and [8.2.3.2] for details. If an error occurred, a fault message is placed here
 2475 instead.

2476 **9.6 MsgBoxGetNextRequest**

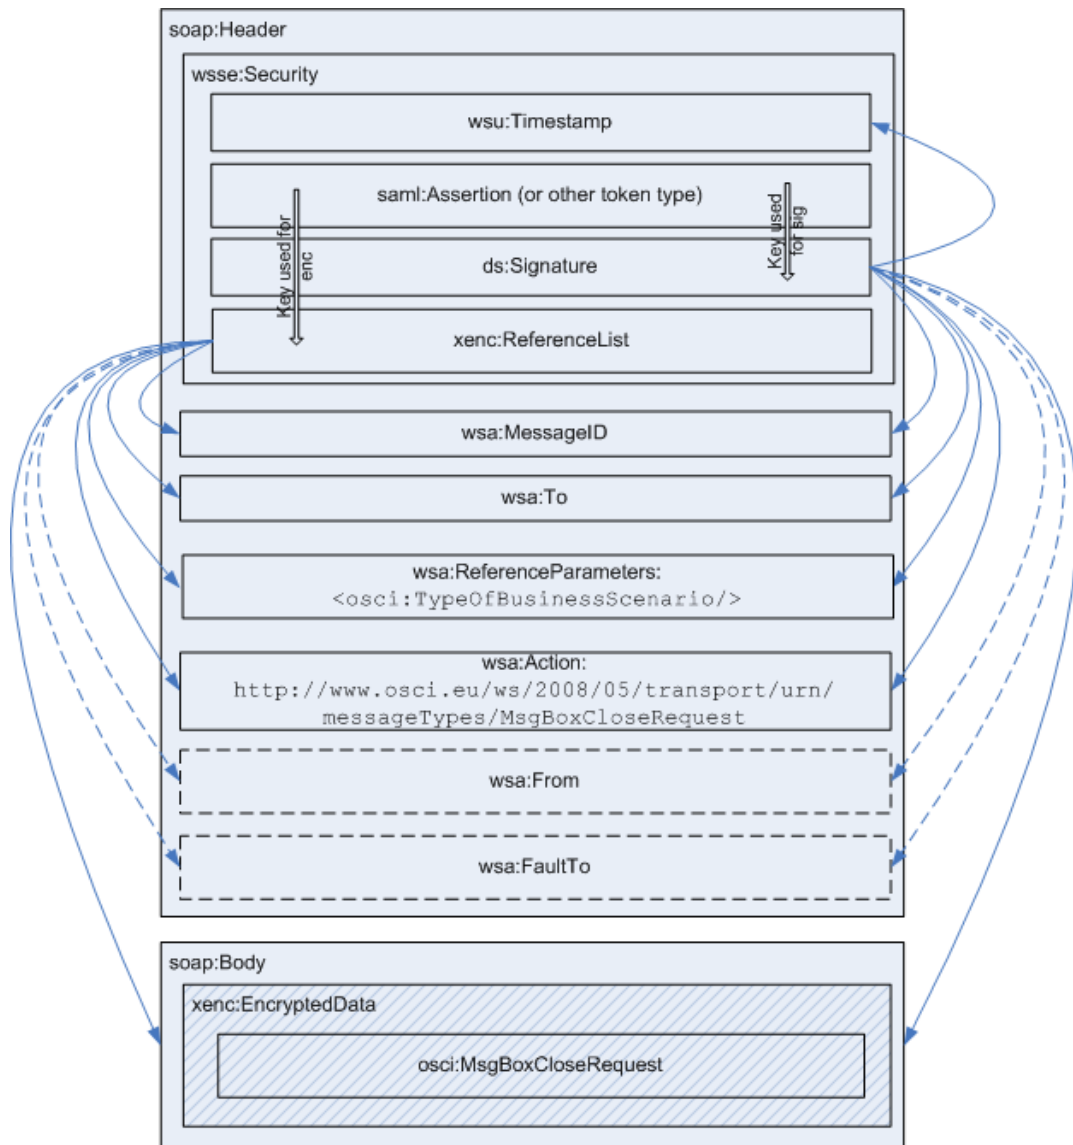

2477

2478

Figure 13: MsgBoxGetNextRequest header and body block assembly

- 2479 SOAP header blocks:
- 2480 `/wsse:Security`
- 2481 This header block MUST be present, carrying message protection data and requestor
- 2482 (MsgBox owner in this case) authentication and authorization information items according
- 2483 the security policy MsgBox instance. See chapter [7.1] for details.
- 2484 `/wsa:*`
- 2485 All WS-Addressing headers MUST (if in continuous blocks) /MAY (if in dashed blocks) be
- 2486 supplied by the Initiator. See chapter [6.1.2] and [8.2.4] for details.
- 2487 SOAP body:
- 2488 Carries the details of the MsgBoxGetNextRequest, generally MUST be transport
- 2489 encrypted. See chapter [8.2.4] for details.

2490 **9.7 MsgBoxCloseRequest**

- 2491
- 2492

Figure 14: MsgBoxClose header and body block assembly

- 2493 SOAP header blocks:
- 2494 **/wsse:Security**
- 2495 This header block **MUST** be present, carrying message protection data and requestor
2496 (MsgBox owner in this case) authentication and authorization information items according
2497 the security policy MsgBox instance. See chapter [7.1] for details.
- 2498 **/wsa:***
- 2499 All WS-Addressing headers **MUST** (if in continuous blocks) /**MAY** (if in dashed blocks) be
2500 supplied by the Initiator. See chapter [6.1.2] and [8.2.5] for details.
- 2501 SOAP body:
- 2502 Carries the details of the MsgBoxCloseRequest, generally **MUST** be transport encrypted.
2503 See chapter [8.2.5] for details.

2504 **10 Policies and Metadata of Communication Nodes and** 2505 **Endpoints**

2506 **10.1 General usage of Web Service Description Language**

2507 The Web Service Description Language (WSDL) provides a broadly-adopted foundation on which
2508 interoperable Web Services can be build. WS-Policy Framework [WSPF] and WS-Policy Attachment
2509 [WSPA] collectively define a framework, model and grammar for expressing the requirements, and
2510 general characteristics of entities in an XML Web Services-based system.

2511 In general, endpoint properties and requirements **MUST** be described in machine readable form of
2512 WSDLs and policies. For sake of interoperability with currently available implementations of the WS-
2513 Stack, this specification restricts to Web Service Description Language 1.1 [WSDL11].

2514 This specification does not assume a mandatory mechanism how WSDLs of endpoints must be made
2515 available. To facilitate retrieval and online exchange of WSDLs, they **SHOULD** be exposed in
2516 appropriate directories OSCI communication networks; the base established mechanism to access a
2517 WSDL of a concrete Web Service endpoint is a http(s) GET-Request in the form

2518 `http(s)://endpoint-url?WSDL.`

2519 Conformant implementations **SHOULD** at least support this mechanism. The specification WS
2520 Metadata Exchange [WSMEX] describes a more sophisticated way to encapsulate services metadata
2521 and a protocol to retrieve it. It allows the client to interact with the service automatically, fetch all
2522 relevant metadata and aids the client in self-configuring. Support of WS Metadata Exchange is
2523 strongly **RECOMMENDED**.

2524 **NOTE on WSDL/Policy integrity:** Policies and WSDL-Files **MUST** be secured by digital signatures to
2525 allow detection of possible corruptions. Unfortunately, there is no standard format and placement
2526 defined so far by the WS-Policy Framework for adequate digital signatures, what obviously results in
2527 the lack of integrity check mechanisms in known framework implementations when accessing policies
2528 and WSDL-Files. An appropriate specification and recommendation for implementors will be published
2529 by the OSCI Steering Office mid 2009 after finishing actually running tests on solution variants
2530 addressing this issue.²³

2531 Endpoints are not forced to expose their properties and requirements in form of online available and
2532 machine readable WSDLs and/or policies. Developers may exchange this information on informal
2533 basis out of scope of this specification (i.e. word-of-mouth, documentation).

2534 **NOTE on WSDL/Policy examples:** Patterns of WSDL instances and reference policies for classes of
2535 OSCI based scenarios will be developed in a distinct project and be made available in step by step in
2536 2009 as addendum to this document.

2537 **Technical NOTE for policy instances:** All policies defined for an endpoint **MUST** carry an Id-
2538 Attribute for the outer element `/wsp:Policy/@wsu:Id` to be referenceable for policy attachment
2539 and metadata exchange purposes.

2540 **10.1.1 WSDL and Policies for MEP synchronous point-to-point**

2541 For this communication scenario, description of endpoint requirements and abilities **SHOULD** be
2542 outlined in one WSDL containing all services and ports with their respective policies available here.
2543 Following general requirements **MUST** be considered when designing WSDL instances:

²³ This work is done in the context of the OSCI Profiling project and will be published as an addendum to this specification. Results are planned to be brought to the appropriate OASIS standardization body.

2544 **R1200** - A `/wsdl111:port` MUST always contain an entry `/wsa:EndpointReference` with the
 2545 `.../wsa:Address` element as well as `.../wsa:ReferenceParameters` outlining the URI of
 2546 the `.../osci:TypeOfBusinessScenario` served by this port²⁴. Each specific
 2547 `/osci:TypeOfBusinessScenario` itself correlates to a concrete Content Data
 2548 message structure given by the `/wsdl111:port` reference chain to a `/wsdl111:binding`
 2549 and `/wsdl111:portType` entry in this WSDL instance.

2550 10.1.2 WSDL and Policies for asynchronous MEPs via Message Boxes

2551 These MEPs at least have two endpoints in view a message is targeted to:

- 2552 • Initially, a Source Application has to build up the SOAP body content according to a concrete
 2553 schema bound to the actual underlying `/osci:TypeOfBusinessScenario`. In addition,
 2554 security requirements bound to the Recipient apply like End-to-end encryption and digital
 2555 signatures to be applied to Content Data, which SHOULD be expressed by according WS
 2556 Security Policy expressions.
- 2557 • For transport to the Recipients `MsgBox` instance, the WSDL and policies of this target node
 2558 apply. For every `/osci:TypeOfBusinessScenario` accepted here, the body structure is of
 2559 type `xenc:EncryptedData`. The WS Security Policy if effect here MUST NOT lead to initiate
 2560 body decryption processing, as the therefore needed private encryption key is only known to
 2561 the Recipient node.

2562 As of today known WS-Framework implementations, WS Security Policies attached in the WSDL of
 2563 the node a message is targeted to are completely in effect at the targeted node; it is not possible to
 2564 bind them e.g. to a specific `s12:role` without in-depth change of processing logic of standard WS-
 2565 Framework implementations.

2566 To solve this problem, for this version of the OSCI Transport specification following recommendation
 2567 applies²⁵:

- 2568 • The `MsgBox` node exposes the WSDL and policies according his needs on opaque body,
 2569 transport security and authentication/authorization per accepted
 2570 `/osci:TypeOfBusinessScenario`.
- 2571 • WSDL and policies in effect for the Recipient node are referenced or contained in the
 2572 `/wsa:EndpointReference/wsa:Metadata` element as described in chapter [6.1.1], bound
 2573 to the `/wsdl111:port` policy attachment point.

2574 10.2 OSCI specific Characteristics of Endpoints

2575 To enable OSCI endpoints to describe their requirements and capabilities, this specification defines
 2576 OSCI policy assertions that leverage the WS-Policy framework. In general, it is RECOMMENDED to
 2577 attach the policy assertions defined here to a to a port [WSDL11] respective endpoint [WSDL20] policy
 2578 subject.

2579 10.2.1 Certificates used for Signatures and Encryption

2580 For OSCI based message exchange, X.509v3-Certificates MUST be used for following purposes:

- 2581 • Encryption to be processed on Initiator side
 - 2582 ○ End-to-end encryption of Content Data targeted from a Source Application to a
 - 2583 Target Application

²⁴ following chapter [6.1.1], use of WS-Addressing in OSCI

²⁵ A WSDL/Policies template for this MEP as well as `MsgBox` access thru the recipient will be made available as addendum immediately after publishing this specification

- 2584 ○ Transport encryption, in cases where asymmetric encryption is required by a specific
- 2585 application scenario – in general expressed by an adequate security policy
- 2586 • Certificates used for signatures at Recipient side (respective his MsgBox service); an Initiator
- 2587 MAY – in cases of doubt - cross-check whether received signatures are generated with the
- 2588 certificates exposed in this endpoint policy (detection of possible man-in-the-middle attacks):
- 2589 ○ Signature application for OSCI receipts and possible other message parts – in cases
- 2590 where the signature must be useable for long term provableness
- 2591 ○ If offered: Generation of cryptographic time stamps.

2592 Additional application purposes MAY be defined and supported by dedicated implementations.

2593 Syntax for the OSCI policy containing assertions for X.509v3-Certificates usages:

```

2594 <wsp:Policy wsu:Id="xs:ID">
2595   <osci:X509CertificateAssertion>
2596     <wsp:ALL>
2597       <wsse:SecurityTokenReference wsu:Id="xs:ID" ?
2598         Usage=
2599         "http://www.osci.eu/ws/2008/05/common/names/TokenUsage/e2eContentEncryption"
2600       |
2601       "http://www.osci.eu/ws/2008/05/common/names/TokenUsage/TransportEncryption"
2602     "
2603     |
2604     "http://www.osci.eu/ws/2008/05/common/names/TokenUsage/ReceiptSigning"
2605     |
2606     "http://www.osci.eu/ws/2008/05/common/names/TokenUsage/TSPSigning" *
2607     osci:Role=
2608     "http://www.osci.eu/ws/2008/05/transport/role/Recipient" |
2609     "http://www.osci.eu/ws/2008/05/transport/role/MsgBox" |
2610     "http://www.w3.org/2003/05/soap-envelope/role/ultimateReceiver" * >
2611
2612     ( <wsse:Embedded ValueType="xs:anyURI" ? >
2613       <wsse:BinarySecurityToken wsu:Id="xs:ID" ?
2614         ValueType=
2615         "http://docs.oasis-open.org/wss/2004/01/
2616           oasis-200401-wss-x509-token-profile-1.0#X509v3"
2617         EncodingType=
2618         "http://docs.oasis-open.org/wss/2004/01/
2619           oasis-200401-wss-soapmessage-security-1.0#Base64Binary" >
2620         xs:base64Binary
2621       </wsse:BinarySecurityToken>
2622     </wsse:Embedded> )
2623     |
2624     ( <wsse:Reference URI="xs:anyUri"
2625       ValueType=
2626       "http://docs.oasis-open.org/wss/2004/01/
2627         oasis-200401-wss-x509-token-profile-1.0#X509v3" /> )
2628     |
2629     ( <wsse:KeyIdentifier wsu:Id="xs:ID" ?
2630       ValueType=
2631       "http://docs.oasis-open.org/wss/
2632         oasis-wss-soap-message-security-1.1#ThumbprintSHA1"
2633       EncodingType=
2634       "http://docs.oasis-open.org/wss/2004/01/
2635         oasis-200401-wss-soapmessage-security-1.0#Base64Binary">
2636       xs:base64Binary
2637     </wsse:KeyIdentifier> )
2638
2639     </wsse:SecurityTokenReference
2640   </wsp:ALL>
2641 </osci:X509CertificateAssertion>
2642 </wsp:Policy>

```

2643 Description of elements and attributes in the schema overview above:

2644 **/wsp:Policy**

2645 The whole assertion MUST be embedded in a policy block according to WS Policy.

2646 `/wsp:Policy/@wsu:Id`

2647 To be referenceable, the policy MUST carry an attribute of type `xs:ID`.

2648 `/wsp:Policy/osci:X509CertificateAssertion`

2649 The policy block containing all assertions.

2650 `/wsp:Policy/osci:X509CertificateAssertion/wsp:ALL`

2651 Following the semantics of WS Policy Framework [WSPF], all behaviours represented by
2652 the assertions embedded in this block are required/valid.

2653 `/wsp:Policy/osci:X509CertificateAssertion/wsp:ALL/wsse:SecurityTokenReferen`
2654 `ce`

2655 This element defined in WS Security [WSS] MUST be used as container for a single
2656 X.509v3-Certificate (or a reference to it) and its attributes.

2657 As all single certificate details are contained in this block, for brevity full path qualification

2658 `/wsp:Policy/osci:X509CertificateAssertion/wsp:ALL/wsse:SecurityTokenReferen`
2659 `ce` is symbolized by `[SingleToken]` in the following descriptions.

2660 `[SingleToken]/@wsu:id`

2661 A certificate contained/described in this policy MUST be uniquely referenceable – i.e.,
2662 from other policies describing the same endpoint. This attribute of type `xs:ID` MUST
2663 carry an appropriate unique value.

2664 `[SingleToken]/@Usage`

2665 This attribute defines the purposes a certificate is used for, at least one of the URIs
2666 outlined above MUST be supplied as value in this attribute of type list of `xs:anyURI`.

2667 Predefined usage semantics are:

Usage for	URI
End-to-end encryption of Content Data	<code>http://www.osci.eu/ws/2008/05/common/names/TokenUsage/e2eContentEncryption</code>
Asymmetric transport encryption	<code>http://www.osci.eu/ws/2008/05/common/names/TokenUsage/TransportEncryption</code>
Signature of OSCI receipts; also applicable for signatures of other message parts	<code>http://www.osci.eu/ws/2008/05/common/names/TokenUsage/ReceiptSigning</code>
Generation of cryptographic time stamps	<code>http://www.osci.eu/ws/2008/05/common/names/TokenUsage/TSPSigning</code>

2668 Table 9: OSCI X.509-Token usages

2669 `[SingleToken]/@osci:Role`

2670 This attribute defines logical roles a certificate is assigned to, at one of the URIs outlined
2671 above MUST be supplied value in this attribute of type list of `xs:anyURI`. Regularly, a
2672 single certificate SHOULD NOT be assigned to more the one role; as constellations are
2673 imaginable, where logical roles are pooled – like for a Recipient and Ultimate Recipient
2674 which are using the same signature certificate - in these cases more than one role
2675 assignment MAY be used.

2676 For example, this role attribute allows Initiators to control, whether a receipt is signed with
 2677 the right certificate used by the specific receipt issuer role outlined in the receipt.

2678 Predefined logical roles are:

Usage for	URI
OSCI Recipient – i.e. using this certificate for signing DeliveryReceipts in synchronous case or as transport encryption certificate	http://www.osci.eu/ws/2008/05/transport/role/Recipient
Ultimate receiver in the sense of [SOAP12]; i.e. an Ultimate Recipient using this certificate for end-to-end encryption or ReceptionReceipt signing	http://www.w3.org/2003/05/soap-envelope/role/ultimateReceiver
MsgBox service node; i.e. may have his own transport encryption certificate (as MUST be used for "one time tokens")	http://www.osci.eu/ws/2008/05/common/names/role/MsgBox

2679 Table 10: SOAP/OSCI roles assigned to token usages

2680 **R1200** - Inside a [SingleToken], the certificate itself may be embedded, referenced or identified by
 2681 a thumbprint. Other choices foreseen by WS-Security for
 2682 `/wsse:SecurityTokenReference` MUST NOT be used.

2683 Choice for embedded tokens

2684 `[SingleToken]/wsse:Embedded`

2685 This choice MUST be taken for embedding X.509v3-Certificates. It is strongly
 2686 RECOMMENDED to use this choice for certificates to be used for encryption purposes, as
 2687 an Initiator and STS may need the respective public key for encryption. Referencing those
 2688 certificates could cause additional to network connection needs.

2689 `[SingleToken]/wsse:Embedded/@ValueType`

2690 This element MAY carry this attribute of type `xs:anyURI`. It is not used in the context of this
 2691 policy.

2692 `[SingleToken]/wsse:Embedded/wsse:BinarySecurityToken`

2693 Generic container to carry security tokens in binary format; MUST contain the X.509v3-
 2694 Certificate in base64Binary format.

2695 `[SingleToken]/wsse:Embedded/wsse:BinarySecurityToken/@wsu:Id`

2696 This attribute of type `xs:ID` is optional. It is not used in the context of this policy.

2697 `[SingleToken]/wsse:Embedded/wsse:BinarySecurityToken/@ValueType`

2698 As only X.509v3-Certificates are described/contained here, the URI outlined above MUST
 2699 be supplied as value in this attribute of type of `xs:anyURI`.

2700 `[SingleToken]/wsse:Embedded/wsse:BinarySecurityToken/@EncodingType`

2701 Hence X.509v3-Certificates MUST be encoded in base64Binary format here, the URI
 2702 outlined above MUST be supplied as value in this attribute of type of `xs:anyURI`.

2703 Choice for directly referencing tokens

2704 `[SingleToken]/wsse:Reference`

2705 This choice MUST be taken if referencing X.509v3-Certificates stored otherwise.

2706 `[SingleToken]/wsse:Reference/@URI`

2707 This attribute of type `xs:anyURI` MUST identify a X.509v3-Certificate. If a fragment is
 2708 specified, then it indicates the local ID of the security token being referenced. The URI
 2709 MUST NOT identify a `/wsse:SecurityTokenReference` element, a
 2710 `/wsse:Embedded` element, a `/wsse:Reference` element, or a
 2711 `/wsse:KeyIdentifier` element.

2712 `[SingleToken]/wsse:Reference/@ValueType`

2713 As only X.509v3-Certificates are described/contained here, the URI outlined above MUST
 2714 be supplied as value in this attribute of type of `xs:anyURI`.

2715 Choice for referencing tokens by thumbprint

2716 This choice SHOULD NOT be used for certificates to be used for encryption purposes, as this may
 2717 burden Initiator and STS to locate the needed public key for encryption.

2718 `[SingleToken]/wsse:KeyIdentifier`

2719 **R1210:** This choice MUST be taken if referencing X.509v3-Certificates by thumbprint.
 2720 Other choices foreseen by WS-Security for `/wsse:KeyIdentifier` MUST NOT be
 2721 used.

2722 `[SingleToken]/wsse:KeyIdentifier/@wsu:Id`

2723 This attribute of type `xs:ID` is optional. It is not used in the context of this policy.

2724 `[SingleToken]/wsse:KeyIdentifier/@ValueType`

2725 As only thumbprints are allowed for referencing here, the URI outlined above MUST be
 2726 supplied as value in this attribute of type of `xs:anyURI`.

2727 `[SingleToken]/wsse:KeyIdentifier/@EncodingType`

2728 Hence thumbprints MUST be encoded in base64Binary format here, the URI outlined
 2729 above MUST be supplied as value in this attribute of type of `xs:anyURI`.

2730 **NOTE on usage of alternate certificates for the same purpose and role:**

2731 If more than one certificate may be used for a combination of `[SingleToken]/@osci:Role` and
 2732 `[SingleToken]/@wsse:Usage`, these policy elements `/wsse:SecurityTokenReference`
 2733 MUST be grouped in a `/wsp:ExactlyOne` container to express that only one of the alternatives may
 2734 be chosen.

2735 10.2.2 Endpoint Services and Limitations

2736 OSCI Recipients respective MsgBox services MAY offer/expose following services and limits:

- 2737 • Qualified timestamp application for signatures; this service is requestable by an Initiator for
 2738 receipts;
- 2739 • Message lifetime control; this service interprets the
 2740 `/osci:MsgTimeStamps/osci:ObsoleteAfter` SOAP header element probably set by an
 2741 Initiator. This marker only makes sense in asynchronous MEPs, hence the processing policy
 2742 assigned to is only of interest for MsgBox instances;
- 2743 • Maximum accepted message size and acceptance frequency per hour.

2744 Syntax for OSCI endpoint services policy assertions:

2745 `<wsp:Policy wsu:Id="xs:ID">`
 2746

```

2747 <osci:QualTSPAssertion PolicyRef="xs:anyURI"? > ?
2748
2749 <osci:ObsoleteAfterAssertion PolicyRef="xs:anyURI" ? > ?
2750 <osci:MsgRetainDays>
2751   xs:positiveInteger
2752 </osci:MsgRetainDays> ?
2753 <osci:WarningMsgBeforeObsolete>
2754   xs:nonNegativeInteger
2755 </osci:WarningMsgBeforeObsolete> ?
2756 </osci:ObsoleteAfterAssertion> ?
2757
2758 <osci:MsgLimitsAssertion>
2759   <osci:MaxSize>
2760     xs:positiveInteger
2761   </osci:MaxSize> ?
2762   <osci:MaxPerHour>
2763     xs:positiveInteger
2764   </osci:MaxPerHour> ?
2765 </osci:MsgLimitsAssertion> ?
2766
2767 <wsp:Policy>

```

2768 Description of elements and attributes in the schema overview above:

2769 **/wsp:Policy**

2770 The whole assertion **MUST** be embedded in a policy block according to WS Policy.

2771 **/wsp:Policy/@wsu:Id**

2772 To be referenceable, the policy **MUST** carry an attribute of type **xs:ID**.

2773 **/wsp:Policy/osci:QualTSPAssertion ?**

2774 The presence of this element signals the availability of a qualified timestamp service.

2775 **/wsp:Policy/osci:QualTSPAssertion/@PolicyRef ?**

2776 This optional attribute of type **xs:anyURI** **SHOULD** be provided and carry a link to i.e. human readable policies describing terms and conditions under which this service is made available.

2779 **/wsp:Policy/osci:ObsoleteAfterAssertion ?**

2780 The presence of this element signals the fact this endpoint will care about a SOAP header entry **/osci:MsgTimeStamps/osci:ObsoleteAfter**.

2782 **/wsp:Policy/osci:ObsoleteAfterAssertion/@PolicyRef ?**

2783 This optional attribute of type **xs:anyURI** **MAY** be provided and carry a link to i.e. human readable policies describing terms and conditions about deletion of messages marked to be obsolete meanwhile.

2786 **/wsp:Policy/osci:ObsoleteAfterAssertion/MsgRetainDays ?**

2787 This optional element of type **xs:positiveInteger** **SHOULD** be provided to expose the number of days a message still is hold available after the date provided by the **.../osci:ObsoleteAfter** entry.

2790 **/wsp:Policy/osci:ObsoleteAfterAssertion/WarningBeforeObsolete ?**

2791 This optional element of type **xs:nonNegativeInteger** **SHOULD** be provided to expose the number of days a warning is generated before the date provided by the **.../osci:ObsoleteAfter** entry. Thus, an escalation procedure could be triggered for messages seen to be of high importance. How this warning is generated and delivered is

2795 a matter of implementation of this service and SHOULD be described in the terms and
2796 conditions policy.²⁶

2797 `/wsp:Policy/osci:MsgLimitsAssertion ?`

2798 The presence of this element signals the fact this endpoint has restrictions for incoming
2799 messages.

2800 `/wsp:Policy/osci:MsgLimitsAssertion/MaxSize ?`

2801 This optional element of type `xs:positiveInteger` outlines the maximum size in
2802 kilobytes for incoming messages this endpoint accepts.

2803 If an incoming message exceeds this limit, it MUST be withdrawn and a fault MUST be
2804 returned to the targeting node:

2805 Fault 14: `MsgSizeLimitExceeded`

2806 [Code] Sender

2807 [Subcode] `MsgSizeLimitExceeded`

2808 [Reason] Message size exceeds policy

2809 `/wsp:Policy/osci:MsgLimitsAssertion/MaxPerHour ?`

2810 This optional element of type `xs:positiveInteger` outline the maximum amount in of
2811 messages accepted per hour from the same originating node²⁷.

2812 If an incoming messages originated from the same targeting node exceed this limit, the
2813 message MUST be withdrawn and a fault MUST be returned to the targeting node:

2814 Fault 15: `MsgFrequencyLimitExceeded`

2815 [Code] Sender

2816 [Subcode] `MsgFrequencyLimitExceeded`

2817 [Reason] Message frequency per hour exceeds policy

2818 10.3 WS Addressing Metadata and WS MakeConnection

2819 Hence the use of WS-Addressing is mandatory for OSCI, an endpoint policy MUST contain WS-
2820 Addressing properties described here in terms of WS-Addressing Metadata [WSAM] .

2821 Following policy assertions MUST be bound to the `ws1d11:port` (WSDL 2.0: endpoints) or
2822 `wsdl11:binding` endpoint policy subjects which accept messages of type `osci:Request`; WS
2823 `MakeConnection` is not supported in this case:

```
2824 <wsp:Policy wsu:Id="xs:ID" ?>
2825   <wsam:Addressing>
2826     <wsp:Policy/> ?
2827   </wsam:Addressing>
2828 </wsp:Policy>
```

2829 This policy ascertains the use of WS-Addressing and that the endpoint requires request messages to
2830 use response endpoint EPRs that contain something other than the anonymous URI as the value in
2831 the SOAP header element `/wsa:ReplyTo/wsa:Address`.

```
2832 <wsp:Policy wsu:Id="xs:ID" ?>
2833   <wsmc:MCSupported/>
2834
```

²⁶ This warning could i.e. be delivered in the body of an `osci:Request` to the Initiator alike the `FetchNotification` message.

²⁷ No further details defined here, it is left to implementations how to define appropriate count starting and reset points

2835 `</wsp:Policy> ?`

2836 This policy assertion MUST only be used, if WS MakeConnection is supported by this endpoint (see
2837 chapter [6.2]). In this case, the value of `/wsa:ReplyTo/wsa:Address` MUST be the WS-MC
2838 anonymous URI template

2839 `http://docs.oasis-open.org/ws-rx/wsmc/200702/anonymous?id={unique-String}`.

2840 Following policy assertions MUST be bound to `wsdl11:ports` (WSDL 2.0: endpoints) or
2841 `wsdl11:binding` policy subjects accepting messages for MsgBox access - these are the message
2842 of type `MsgBoxFetchRequest`, `MsgBoxStatusListRequest`, `MsgBoxGetNextRequest` and
2843 `MsgBoxCloseRequest`:

```
2844 <wsp:Policy wsu:Id="xs:ID" ?>
2845   <wsam:Addressing>
2846     <wsp:Policy>
2847       <wsam:AnonymousResponses/>
2848     <wsp:Policy>
2849   </wsam:Addressing>
2850 </wsp:Policy>
```

2851 This policy ascertains the use of WS-Addressing and that the endpoint requires request messages to
2852 use response endpoint EPRs that carry an URI value of

2853 `"http://www.w3.org/2005/08/addressing/anonymous"`

2854 in the SOAP header element `/wsa:ReplyTo/wsa:Address`.

2855 10.4 WS Reliable Messaging Policy Assertions

2856 Support of WS Reliable Messaging is an optional feature of conformant implementations. If supported,
2857 adequate policy assertions SHOULD be used to ascertain the details of reliable messaging exchange.
2858 We refer to the specification WS Reliable Messaging Policy Assertions Version 1.1 [WSRMP] in this
2859 point with no further profiling.

2860 10.5 MTOM Policy Assertion

2861 The SOAP Message Transmission Optimization Mechanism [MTOM] MUST be supported by
2862 conformant implementations. The MTOM policy assertion MUST be attached to either a
2863 `wsdl11:binding` or `wsdl11:port` endpoint policy subject. It is expressed as

```
2864 <wsp:Policy wsu:Id="xs:ID" ?>
2865   <wspmtom:OptimizedMimeSerialization/>
2866 </wsp:Policy> ?
```

2867 We refer to the specification draft [MTOMP].

2868 10.6 WS Security Profile and Policy Assertions

2869 10.6.1 Endpoint Policy Subject Assertions

2870 The binding's outlines in this chapter apply for transport level encryption and signature²⁸.

2871 10.6.1.1 Symmetric Binding

2872 The symmetric binding assertion defines details of message protection by means of WS-Security
2873 [WSS]. In both directions from the Initiator to the Recipient or his MsgBox instance and backwards the
2874 same security tokens are used for transport level encryption and signature.

2875 According to [WSSP], this assertion SHOULD apply to the endpoint policy subject `wsdl11:binding`;
2876 it MAY apply to operation policy subject `wsdl11:binding/wsdl11:operation`.

2877 Requirements outlined in this document for message security lead to following restrictions of overall
2878 options defined by WS Security Policy (see [WSSP], chapter 7.4).

2879 As described in chapter [7.5, R0600], SAML Token issued by STS instances MUST be used, which
2880 here leads to:

2881 **R1230** - This profiling restricts to the usage of `wssp:ProtectionToken`; distinct
2882 `wssp:EncryptionToken` and `wssp:SignatureToken` MUST NOT be used.

2883 10.6.1.2 Asymmetric Binding

2884 For the asymmetric binding, public keys of X.509v3 certificates are used as security tokens. The
2885 support of this binding is OPTIONAL; it MUST be used in case of anonymous access is supported as
2886 described in chapter [6.2].

2887 According to [WSSP], this assertion SHOULD apply to the endpoint policy subject `wsdl11:binding`;
2888 it MAY apply to operation policy subject `wsdl11:binding/wsdl11:operation`.

2889 Used certificates MUST have the according key usage set; R0610 and R0620 (see chapter [7.4])
2890 apply here and in addition:

2891 **R1240** - The node a message is targeted to MUST verify the validity of certificates used for
2892 encryption; in case a value other than valid at time of usage is stated, the message MUST
2893 be discarded and a fault MUST be generated.

2894 Fault 16: **EncryptionCertNotValid**

2895 [Code] Sender

2896 [Subcode] EncryptionCertNotValid

2897 [Reason] Encryption certificate not stated to be valid

2898 More information about the certificate validation results SHOULD be provided in the fault
2899 [Details] property in this case. It is strongly RECOMMENDED to log such faults to be able
2900 to detect possible security violation attacks.

2901 In the context where certificates are used by a Recipient or his MsgBox node (as described in the
2902 chapter [10.2.1]), the assertions `/wssp:RecipientEncryptionToken` and
2903 `/wssp:RecipientSignatureToken` SHOULD point to the according certificate entries in in the
2904 Recipients metadata file.

²⁸ Note, that for end-to-end encryption of Content Data a hybrid technique as defined in [7.3.1] must be used.

2905 **10.6.1.3 Transport Binding**

2906 The transport binding MAY be used in scenarios in which message protection and security correlation
2907 is provided by means other than WS-Security. We restrict to HTTPS here:

2908 **R1250** - HTTPS MUST be used, if message protection is provided by the underlying transport
2909 protocol.

2910 This assertion MUST apply to the endpoint policy subject `wsd111:binding`.

2911 **10.6.2 Message Policy Subject Assertions**

2912 [WSSP] offers policy statements for directions, which message parts must be present and which
2913 message parts have to be signed and encrypted. For the here presented profiling, assertions on the
2914 SOAP header and body block level are REQUIRED, assertions on element level according to [WSSP]
2915 MAY be used in addition.

2916 Following outlines only show the syntax of these assertions; following requirement applies:

2917 **R1260** - Concrete instances MUST enumerate the header and body blocks marked as mandatory
2918 for presence, to be signed and/or encrypted according to definitions made per message
2919 type in chapter [9, Constituents of OSCI Message Types].

2920 Required message parts policy assertion:

```
2921 <wsp:Policy>
2922   <wsp:ExactlyOnce>
2923     <wsp:ALL>
2924       <wssp:RequiredParts xmlns:wssp="..." ... >
2925         <wssp:Header Name="xs:NCName"? Namespace="xs:anyURI" ... /> +
2926       </wssp:RequiredParts>
2927     </wsp:ALL>
2928   </wsp:ExactlyOnce>
2929 </wsp:Policy>
```

2930 Signed message parts policy assertion:

```
2931 <wsp:Policy>
2932   <wsp:ExactlyOnce>
2933     <wsp:ALL>
2934       <wssp:SignedParts xmlns:wssp="..." ... >
2935         <wssp:Body />
2936         <wssp:Header Name="xs:NCName"? Namespace="xs:anyURI" ... /> +
2937       </wssp:SignedParts>
2938     </wsp:ALL>
2939   </wsp:ExactlyOnce>
2940 </wsp:Policy>
```

2941 **NOTE:** According to R1230, the SOAP body block always MUST be included in the transport
2942 signature to ensure integrity of coherence with the message header block parts.

2943 Encrypted message parts policy assertion:

```
2944 <wsp:Policy>
2945   <wsp:ExactlyOnce>
2946     <wsp:ALL>
2947       <wssp:EncryptedParts xmlns:wssp="..." ... >
2948         <wssp:Body /> ?
2949         <wssp:Header Name="xs:NCName"? Namespace="xs:anyURI" ... /> *
2950       </wssp:EncryptedParts>
2951     </wsp:ALL>
2952   </wsp:ExactlyOnce>
2953 </wsp:Policy>
```

2954 If potentially unsecured network connections are used for message exchange, following requirement
2955 applies:

2956 **R1270** - If the Content Data carried in the SOAP body is not encrypted end-to-end, the body block
2957 MUST be transport encrypted.

2958 To include the required SOAP header blocks of the different OSCI message types, following
 2959 requirement applies:

2960 **R1280** - These policy assertions MUST be bound to the message policy subject:

2961 wsdl11:binding/wsdl11:operation/wsdl11:input

2962 respective

2963 wsdl11:binding/wsdl11:operation/wsdl11:output

2964 10.6.3 Algorithm Suite Assertions

2965 In the chapters [7.2.1 and 7.3.2], restrictions are defined to suitable cryptographic algorithms, which
 2966 leads to following restrictions²⁹:

2967 **R1290** - For the symmetric case, following restriction applies for the algorithm suite assertion:

```
2968 <wsp:Policy>
2969   <wssp:AlgorithmSuite>
2970     <wsp:Policy>
2971       ( <wssp:Basic256Sha256 ... /> |
2972         <wssp:Basic192Sha256 ... /> |
2973         <wssp:Basic128Sha256 ... /> |
2974         <wssp:TripleDesSha256 ... /> )
2975     </wsp:Policy>
2976   </wssp:AlgorithmSuite>
2977 </wsp:Policy>
```

2978 **R1300** - For the asymmetric case, following restriction applies for the algorithm suite assertion:

```
2979 <wsp:Policy>
2980   <wssp:AlgorithmSuite>
2981     <wsp:Policy>
2982       ( <wssp:Basic256Sha256Rsa15 ... /> |
2983         <wssp:Basic192Sha256Rsa15 ... /> |
2984         <wssp:Basic128Sha256Rsa15 ... /> |
2985         <wssp:TripleDesSha256Rsa15 ... /> )
2986     </wsp:Policy>
2987   </wssp:AlgorithmSuite>
2988 </wsp:Policy>
```

2989 The scope of these assertions is defined by its containing assertion.

2990 **R1310** - Algorithm suite assertions MUST at least be included in assertions bound to the the
 2991 endpoint policy subject **wsdl11:binding**. In addition, variations MAY be bound to
 2992 subordinary policy subjects to express specific requirements.

²⁹ As of today, there are not yet algorithm identifier assertions defined for SHA512 and RIPEMD160. As these are recommended algorithms, this will be aligned with the reusable OASIS TC and completed as soon as possible by corrigenda for this document.

2993 **11 Applying End-to-end Encryption and Digital Signatures** 2994 **on Content Data**

2995 Predominant for OSCI is exchange of data in an authentic, confidential manner with support for legal
2996 binding. Hence, functionalities are needed for Content Data end-to-end encryption and decryption,
2997 application of digital signatures to Content Data and signature validation.

2998 To ensure interoperability and conformance with the EC-Directive on Digital Signatures as well the
2999 German Signature Law and -Ordinance and underlying technical specifications, these optional
3000 functionalities – if provided – MUST be realized conformant to the "Common PKI Specifications for
3001 Interoperable Applications, Part 7: Signature API" [COMPKI]. This specification is a subset of the
3002 "eCard-API Framework" [eCardAPI], based on standards worked out by the OASIS Digital Signature
3003 Services Technical Committee [DSS].

3004 The Common PKI Signature API defines an XML interface for – among others – following functions:

- 3005 • SignRequest
- 3006 • VerifyRequest
- 3007 • EncryptRequest
- 3008 • DecryptRequest.

3009 API bindings are defined for C and Java; on base of the XML definitions the defined functions could
3010 also be realized as services provided by an OSCI Gateway implementation.

3011 To use the OSCI-feature of certificate validation on the message route, messages producing instances
3012 SHOULD supply certificates used for cryptographical operations on Content Data level in a structure
3013 described as "X.509-Token Container" in chapter [8.4.1]. This container must be carried in a message
3014 as custom SOAP header block.

3015 On the message consuming side, the resulting custom SOAP headers `/xkms:ValidateResponse`
3016 SHOULD be used to simplify signature verification, as the burden of connecting to CAs is delegated to
3017 specialized nodes on the message route. See chapter [8.4] for details.

3569 Appendix B. Example: OSCI Endpoint Metadata 3570 Instance

3571 This example is a policy instance of the schema explained in chapter [10.2]. The encryption and
3572 signature certificates exposed in this policy are addressed by URI references; according to [WSS]
3573 they could also be embedded in this policy file itself in base64Binary format.

3574 This endpoint exposes different encryption and signature certificates for the MsgBox and Recipient /
3575 UltimateRecipient instances. The [ObsoleteAfter] property is handled by this endpoint, while a service
3576 for qualified timestamps is not offered.

3577 For readability of policies used in the OSCI Transport context, it is strongly RECOMMENDED
3578 generally to use the **wsu:id** attribute values highlighted **bold** in this example, as these policy parts
3579 and certificates are referenced by other policies or service instances like a STS (i.e., the latter needs
3580 access to the endpoint encryption certificate for appropriate SAML token encryption).

Appendix D. Change History

3717

Edi- tion	as of	Author	Changes made in chapter / Comments
2	July/ August 2009	Apitzsch	<ol style="list-style-type: none"> 1. 5.1 introduced: How to handle unspecific processing errors 2. 5.2 introduced: Fault delivery and logging 3. 6.2, "Anonymous" replaced by "Non addressable" Initiator 4. 6.3 introduced: Addressing faults 5. 8.2.3: @reason attribute in MsgBoxResponse changed to type xs:anyURI with predefines enumerations 6. 7.5: For interoperability reasons, SAML support exented to SAML version 1.1, too 7. 8.2.3.2: wsa:Action discarded from the response body MsgBoxStatusList/MsgAttributeList, as it contains always the same value in a message send to a MsgBox. (Schema change, too, in this point!) 8. 8.2.3.2: MsgAttributeList, typo corrected BusinessScenarioType -> ref to TypeOfBusinessScenario (Schema change, too, in this point!) 9. 8.2.4, schema simplification: Body of MgBoxGetNextRequest needs no EPR (this EPR is already outlined in initial MsgBoxFetch-/MsgBoxStatusListRequest) 10. 8.3.2, schema description fault correction, <osci:ItemsPending> carries no attribute (no schema change necessary!) 11. 8.3.2.1: Discard message, if production of DeliveryReceipts fails 12. 8.3.3: s12:role with cutom value made optional due to current WCF is not strict SOAP12-conformant at this point 13. 8.3.4, Receipt/Notification processing: No abort of message processing if ReceptionReceipt/notification delivery fails 14. 3.2 and 13.1: Web Service Seruity Scheme (prefix wsse) must point to: http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd 15. Appendix A: OSCI schema replaced with modified version
3	Febru- ary to April 2010	Apitzsch/ Linde- mann/ Schwel- lach	<ol style="list-style-type: none"> 1. Diverse typos (all chapters) 2. WS-I Basis Security Profile – Refrence updatet to final Version available since January, 2010 3. 6.1.1: TypeOfBusinessScenarioType introduced 4. 7.3.1: e2e encryption only MUST when using MsgBox ! 5. 8.x.x.: osci:EPR changed to wsa.EndpointReference 6. 8.x.x and 9.x: wsa:ReplyTo eliminated as header for all message types where this header makes no sence (sync. request/response scenarios) 7. Appendix A: Schema detailed for osci:TypeOfBusinessScenario 8. Schema Element corrections. <ol style="list-style-type: none"> a. MsgBoxClose -> MsgBoxCloseRequest b. ReceptionReceipt,: RelatosTo now cardinality 0..1

			<p>c. MsgSelector: Name change EntryFrom -> EntryTimeFrom,, EntryTo -> EntryTimeTo</p> <p>d. TypeOfBusinessScenarioType introduced</p>
4	December 2010	Apitzsch/ Lindemann	<p>Corrections: changes and detailings in whole document according to comments we got from Martin Girschick, Capgemini (thanks to Martin for his meticulous review!)</p> <p>Major changes effecting implementations are:</p> <ol style="list-style-type: none"> 1. R0510, xenc:EncryptionMethod changed to algorithm http://www.w3.org/2001/04/xmlenc#rsa-oaep-mgf1p 2. ../osci:ReceiptInfo/wsa:RelatesTo : cardinality 0..n 3. XKMS extension namespace and reference pointing to actual PEPPOL WP1 Specification (extension schema has changed in October 2010) 4. xkms:CompoundResult header of cardinality 0..n 5. Description of osci:X509TokenContainer aligned with schema (attributes in schema eliminated) 6. osci:typeOfBusinessScenario elements deleted from osci:MsgBoxFetchRequest and osci:MsgBoxStatuslistRequest, as elements already present in SOAP header.
